

Health Behaviors and Conditions of Adult New Mexicans 2008

Results from the Behavioral Risk Factor Surveillance System (BRFSS)

Health Behaviors and Conditions of New Mexicans, 2008

Results from the New Mexico Behavioral Risk Factor Surveillance System (BRFSS)

> Presented by the New Mexico Department of Health Catherine D. Torres, MD, Secretary

Epidemiology and Response Division
C. Mack Sewell, DrPH, MS, Director, State Epidemiologist
Michael G. Landen, MD, MPH, Deputy State Epidemiologist
Toby Rosenblatt, MPA, Chief, Injury & Behavioral Epidemiology
Vivian Heye, MA, NM BRFSS Coordinator
Wayne A. Honey, MPH, Survey Epidemiologist
Annie L. Hickman, Data Collection Supervisor

Report prepared by:

Wayne A. Honey, MPH

ACKNOWLEDGMENTS

The NM Department of Health and the Epidemiology & Response Division would like to thank the residents of New Mexico who participated in the 2008 survey of the Behavioral Risk Factor Surveillance System (BRFSS). They gave their time and described their health status and related behaviors to help improve the health of all New Mexicans. This report would also not be possible without the tremendous work of the team of interviewers who conducted the interviews.

The 2008 BRFSS survey was funded by a cooperative agreement with the Centers for Disease Control and Prevention (Grant numbers U58/CCU603446-14-2 and U58/CCU622800-01), and through support from the Diabetes Prevention and Control Program, the Chronic Disease Prevention and Control Bureau, the Family Health Bureau, and the Epidemiology & Response Division, of the New Mexico Department of Health.

Thanks to Isaac Romero for providing the map in Appendix II at the end of this report which presents the geographic stratification of the 2008 NM BRFSS sample design.

BRFSS data and supporting documentation are available at:

www.cdc.gov\brfss

Or

http://www.health.state.nm.us/epi/hdata.html under the Health Behaviors tab.

Additionally, BRFSS data and copies of this report and the 2008 questionnaire can be obtained by contacting: Wayne Honey at (505) 476-3595 or wayne.honey@state.nm.us.

WHAT IS THE BRFSS?

Chronic disease, injury, substance abuse, and infectious disease are the leading causes of morbidity and mortality in the U.S. The Behavioral Risk Factor Surveillance System (BRFSS) is an ongoing, nationwide surveillance system that collects data on the prevalence of health conditions in the population and behaviors that affect risk for disease. The surveillance system uses telephone survey methods to collect data in all 50 states, the District of Columbia, Guam, Puerto Rico and the U.S. Virgin Islands. Individuals who are 18 years of age and older, live in a private residential household, and have a landline telephone are eligible for the survey. Adults who live in group homes or in institutions, such as prisons, college dormitories, or nursing homes, or live in a household without a landline telephone, are not eligible for the survey.

The BRFSS was initiated in the early 1980s after significant evidence had accumulated that behaviors played a major role in the risk for premature morbidity and mortality. Prior to that time, periodic national surveys were conducted to evaluate health behaviors for the whole country, but data were not available at the state level. Because states were ultimately responsible for efforts to reduce health risk behaviors, state level data were deemed critical.

At about the same time, telephone surveys were emerging as an acceptable means of collecting prevalence data. Telephone surveys were relatively easy for states and local agencies to administer. As a result of these concurrent developments, telephone surveys were developed by the Centers for Disease Control and Prevention (CDC) to monitor state-level prevalence of the major behavioral risk factors associated with premature morbidity and mortality. Feasibility studies were conducted in the early 1980's, and the CDC established the BRFSS in 1984 with 15 states participating. New Mexico began participating in the BRFSS in 1986.

The CDC has developed a core set of questions that is included in the questionnaire of every state. Optional modules of questions on a variety of topics have been developed by the CDC and made available to the states. Additionally, states are free to include other questions that have been borrowed from other surveys or developed by the state provided that space is available in the questionnaire and the state identifies funding to cover the additional cost. Such questions are referred to as 'state-added' questions.

Participation in the survey is voluntary, and all data collected are confidential. The identity of the respondent is never known to the interviewer, and the last two digits of the phone number are never sent to the CDC. The CDC removes the remaining eight digits of the phone number from the data file after completing a quality assurance protocol.

The BRFSS is supported and coordinated by the Division of Behavioral Surveillance (DBS), Public Health Surveillance Program Office (PHSPO) of the CDC.

The CDC has a web site dedicated to the BRFSS:

http://www.cdc.gov/brfss

This 2008 NM BRFSS report is available in .pdf format at the NM Department of Health website: http://www.health.state.nm.us/

2008 NEW MEXICO BRFSS SURVEY TOPICS

Questions in the 2008 New Mexico BRFSS survey addressed a variety of health topics. Relevant demographic information was also collected. General topics are listed below.

Core Components (all states):

Health Status Healthy Days Health Care Access

Sleep Exercise Diabetes Oral Health

Cardiovascular Disease Prevalence

Asthma Disability Tobacco Use

Alcohol Consumption

Immunization

Falls

Seatbelt Use

Drinking & Driving Women's Health

Prostate Cancer Screening Colorectal Cancer Screening

HIV/AIDS

Emotional Support & Life Satisfaction

Optional Modules Included:

Diabetes

Visual Impairment & Access to Eye Care

Binge Drinking

Random Child Selection

Childhood Asthma Prevalence

State-added Questions on the following topics

were included:

Tribal Affiliation

Indian Health Service Coverage

Veteran's Administration Coverage

Sexual Orientation

Alcohol Dependence

Health Care Access Supplement

Smoke/Carbon Monoxide Detectors

Demographics Section (all states):

Age

Race/Ethnicity Veteran Status Marital Status

Number of Children in Household

Education

Employment Status

Annual Household Income

Current Weight

Height

Weight One Year Ago

Weight Change Intent (asked if weight has changed)

County of Residence Zip Code of Residence

Number of Residential Telephone Numbers

Telephone Coverage History

Gender

Current Pregnancy Status (asked of female respondents

less than 45 years of age)

LIMITATIONS OF BRFSS DATA

Households without telephones are not eligible to participate in the BRFSS survey. Data collected by the Bureau of the Census under contract with the Federal Communications Commission (FCC) indicate that unemployed persons and lower income households are less likely to have telephones. Consequently, the BRFSS sample is likely to include a greater proportion of higher income households and employed persons than the population of the state as a whole.

In recent years, some of the adult population has moved to exclusive use of cell phones. This shift is most pronounced among younger adults. For a variety of methodological and ethical reasons, cell phones were excluded from the BRFSS sample through 2008. The Centers for Disease Control is actively studying the issues related to inclusion of cell phones in the BRFSS and other telephone surveys. The information gathered through these studies will be used to prepare for the inclusion of cell phone numbers in future BRFSS samples.

The BRFSS relies on adults to provide information on their own health behaviors and conditions. Respondents may be reluctant to report behaviors that are considered undesirable such as drinking and driving. Respondents may also have trouble remembering details about past behaviors or may remember them incorrectly. Consequently, the prevalence of these behaviors may be underestimated by the survey.

Telephone interviews have a number of advantages over other sampling methods such as face-to-face interviews and self-administered questionnaires. The lower cost of telephone interviews makes it possible to include a larger number of adults in the survey than would be possible if a face-to-face survey were conducted. Telephone surveys are also easier to monitor for quality assurance purposes than are face-to-face surveys. Self-administered questionnaires will be affected by the literacy of the selected respondents and may be completed by family members other than the one selected.

Response Rates

The BRFSS Cooperation Rate is a response rate that basically reflects the effectiveness of the interviewing process, including random selection of an adult, effective motivation of the respondent to participate, effective implementation of the interview through to the end. It essentially measures the quality of the work of the data collection team. The cooperation rate for the 2008 NM BRFSS was 76.4%. If the 23.6% of eligible adults who were not interviewed differed greatly and in a systematic way from those who completed the interview, the estimates presented herein could be biased.

The Council of American Survey Research Organizations (CASRO) has developed a widely-used measure of survey response, referred to as the CASRO Rate, that reflects the effectiveness of the entire survey process, including the quality of the sample used to conduct the survey. The CASRO Rate is generally lower than the Cooperation Rate. The CASRO Rate for the 2008 NM BRFSS was 58.7%.

DATA PRESENTATION

The data in this report are presented in either tables or graphs, and are the estimated population percentages of adults with a particular condition, risk factor, or behavior. Like any estimate produced from population surveys, the estimates produced from the BRFSS are subject to error (see Appendix I - Sources of Error). Two related measures of error are the standard error (SE) and the 95% confidence interval. Stata 10.0 MP was used to estimate SE and to produce the corresponding 95% confidence interval estimates presented in this report. Stata 10.0 MP is statistical analysis software that considers the complex sample design of the BRFSS to calculate appropriate SE and 95% confidence intervals. Bar graphs included in this report present 95% confidence intervals. In tables, the population estimates are presented along with the 95% confidence intervals. By BRFSS convention, when the marginal total of respondents upon which a particular estimate was based was less than 50, the weighted percentage was not presented because such estimates are deemed unreliable.

In general, population estimates with smaller standard errors are more precise and reliable than population estimates with larger SE. Sample size influences the magnitude of an estimate's probability of error and so affects the likely precision of the estimate. This issue is particularly relevant to some estimates presented by race/ethnicity where the number of Native Americans, Black/African Americans, and Asian and Native Hawaiian or Other Pacific Islander (NHOPI) sampled was small, resulting in large SE and estimates that were unreliable. Discerning possible differences between rates of conditions or risk factors in these smaller populations and the larger White, non-Hispanic and Hispanic populations was often difficult. This issue is relevant to estimates for any small population group, such as a narrowly defined age group, a small number of respondents with a particular health condition, or a small demographic group such as adults who were retired.

With respect to certain conditions and risk factors, particularly those addressed by core BRFSS questions which were asked of respondents in every state, estimates for the state of New Mexico (NM) were compared to estimates for the five neighboring states (Arizona, Colorado, Oklahoma, Texas, and Utah), referred to as Region in this report, and to the U.S. as a whole (U.S. = all 50 states, plus the District of Columbia). These charts are generally presented in the upper right corner of the first page of a given topic. If no such chart is found, the given question was not asked by all states.

DEMOGRAPHICS OF THE 2008 NEW MEXICO SAMPLE

Bernalillo County	1,056	16.7	32.1	32.1
Southeast	1,173	18.8	12.2	12.2
Southwest	1.287	20.7	19.9	19.9

^{*} Those who responded "don't know/not sure" or who refused to respond were excluded. Consequently, the sample sizes across categories for some variables may not add to 6,227.

[¥] Source: U.S. Bureau of the Census. NA indicates that Inter-Censal data were not available for this category.

[§] Due to the complexity of the NM BRFSS sample design, the CDC does not weight by Race/Ethnicity.

To For a list of the counties in each geographic region, see Appendix II at the end of this report.

SUMMARY — NM HEALTH RISK FACTORS AND CHRONIC CONDITIONS

Table 2. This table summarizes the estimated prevalence of various health conditions and behaviors among adult New Mexicans in 2008. New Mexico rates were also compared to rates for the Region ‡ and for the U.S.*, and are presented as being either higher than (), lower than (), or similar to (); no statistically significant difference) the comparison populations.

			New Mexico rates vs.	
Risk Factor/Condition	HP2010 Objective^	Weighted Percent (95% CI)**	Region	U.S.
Have Health Insurance Coverage	100%	80.1 (78.3, 81.7)	Similar	Lower
Have Source of On-going Care (Personal Physician)	≥ 96%	74.0 (72.1, 75.8)	Similar	Lower
Cost prevented necessary medical care in past year	NA	16.9 (15.5, 18.4)	Similar	Higher
No oral health visit in the past year	≥ 56%	34.0 (32.2, 35.9)	Similar	Higher
Flu shot during the past year (Ages 65 years and older)	≥ 90%	69.8 (67.2, 72.2)	Similar	Similar
Pneumococcal vaccine ever (Ages 65 years and older)	≥ 90%	66.1 (63.4, 68.7)	Similar	Similar
Colorectal cancer sigmoidoscopy (Ages 50 years and older)	≥ 50%	55.9 (53.8, 57.9)	Similar	Lower
Mammogram within past 2 years (Female 50 years and older)	≥ 70%	73.5 (71.2, 75.7)	Similar	Lower
No Pap smear within past 3 years	≥ 90	80.7 (77.6, 83.5)	Similar	Similar
Diabetes	NA	7.9 (7.1, 8.7)	Similar	Similar
Current smoking	≤ 12%	19.4 (17.9, 20.9)	Similar	Similar
Binge drinking 5+ drinks on occasion (Males and Females)	< 13.4%	11.4 (10.1, 12.8)	Lower	Lower
Binge drinking 5+ drinks on occasion – Males	< 13.4%	16.4 (14.2, 18.9)	Similar	Lower
Binge drinking 5+ drinks on occasion – Females	< 13.4%	6.6 (5.4, 8.0)	Similar	Lower
Obese (BMI \geq 30.0)	≤ 15%	25.7 (24.1, 27.4)	Similar	Similar
Did not engage in physical activities in the past 30 days	≤ 20%	23.9 (22.3, 25.6)	Similar	Similar

[‡] Regions includes the 5 states that border New Mexico (Arizona, Colorado, Oklahoma, Texas, and Utah).

^{*} U.S.: the 50 states, plus the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands.

^{**} For a discussin of the reasons for using weighted estimates, see Appendix I at the end of this report.

HEALTH STATUS

QUESTION:

"Would you say that in general your health is: excellent, very good, good, fair or poor?"

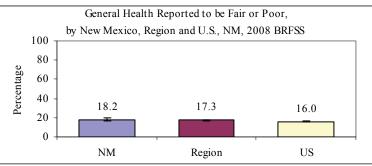

The Centers for Disease Control and Prevention has defined health-related quality of life as "an individual's or group's perceived physical and mental health over time". This question is considered to be a reliable indicator of a person's general health and wellbeing.

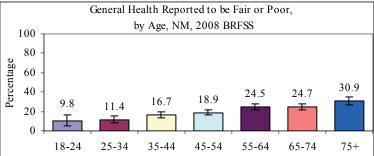

IN NEW MEXICO,

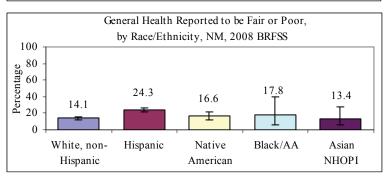

- ♦ 81.8% of New Mexicans reported that their general health was excellent, very good, or good. 18.2% of New Mexico adults reported that their general health was fair or poor. This percentage was not statistically different from the Region* (17.3%) but was higher than that of the U.S.** (16.0%).
- Older adult New Mexicans were more likely to report fair or poor general health status.
- ♦ Adult Hispanics were more likely to report fair or poor general health status than White, non-Hispanics. After adjustment for differences in age distribution, Hispanics were also more likely to report fair or poor health than Native Americans who were more likely to report fair or poor health than White, non-Hispanics. Estimates for the Black/AA and Asian/NHOPI populations are presented here but small sample size for these populations did not allow appropriate statistical comparison to other groups.
- New Mexicans with higher education or income were much less likely to report fair or poor general health status even though these adults were older, on average, than adults with less education or lower annual household income.

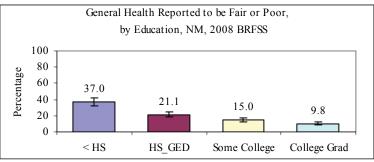

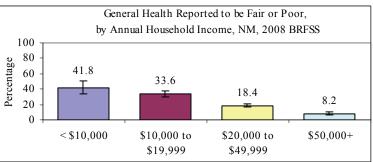

^{**} U.S. includes the 50 states plus the District of Columbia.

New Mexicans who were unemployed were more likely to report fair or poor general health status.

GENERAL HEALTH STATUS

DAYS OF LIMITED ACTIVITY DUE TO POOR HEALTH

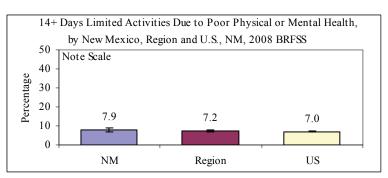

QUESTION:

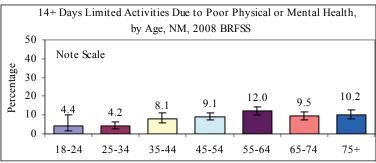

"During the past 30 days, for about how many days did poor physical or mental health keep you from doing your usual activities, such as self-care, work, or recreation?"

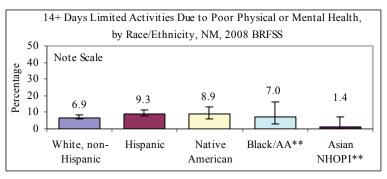

This question provides an indication of the burden of acute and chronic conditions in the population.¹

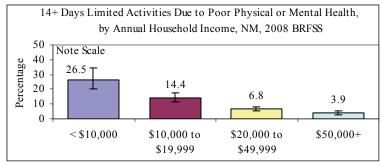

IN NEW MEXICO,

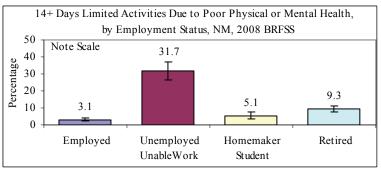

- ♦ Over all, 7.9% of New Mexicans reported that their physical or mental health kept them from participating in usual activities for 14 or more days during the past 30 days. This percentage was not statistically different from that of the Region (7.2%) or that of the U.S. (7.0%).
- ♦ There was no measurable difference by gender or region of residence, even after adjusting for differences in age distribution.
- Adults who were Asian/NHOPI were less likely to report 14 or more days of limited activity than adult Hispanics (or Native Americans after adjusting for age).
- ♦ Poor physical or mental health was associated with age, adults above age 34 being more likely to report activity limitations.
- New Mexicans with less education or lower income were more likely to report activity limitations due to poor physical or mental health.
- ♦ Adults below an approximation of the Federal Poverty Level (FPL) were than two times as likely to report 14 or more days of activity limitation due to poor physical or mental health than those above the FPL.
- ♦ Employed New Mexicans (3.1%) were less likely to report activity limitations due to poor physical or mental health than adults who were unemployed (14.6%) or unable to work (53.6%), grouped together here at 31.7%, or who were retired (9.3%). Adjustment for age did not affect this relationship.

HEALTH CARE COVERAGE

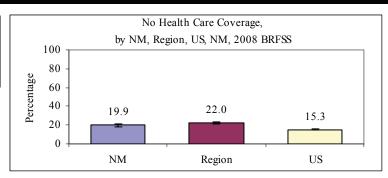

QUESTION:

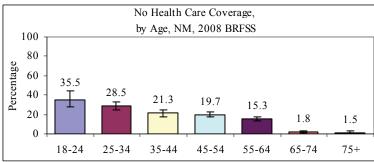

"Do you have any kind of health care coverage, including health insurance, prepaid plans such as HMOs, or government plans such as Medicare?"

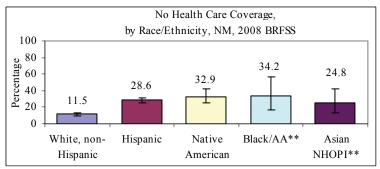

Lack of health care coverage has been associated with delayed access to health care and increased risk of late stage diagnosis of chronic disease and mortality.² People without health coverage are much less likely than those with coverage to receive recommended preventive services and medications, are less likely to have access to regular care by a personal physician, and are less able to obtain needed health care services. Consequently, the uninsured are more likely to succumb to preventable illnesses, more likely to suffer complications from those illnesses, and are more likely to die prematurely.^{2,3}

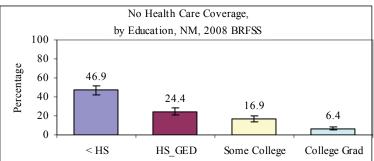

IN NEW MEXICO,

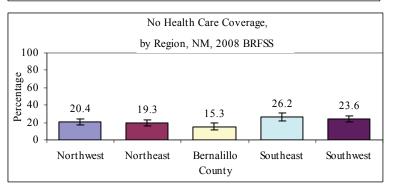

- The percentage of adults in New Mexico without health care coverage (19.9%) was similar to that of the Region (22.0%) both of which were higher than that of the U.S. (15.3%).
- Health care coverage was also associated with age as those in younger age groups were less likely to have coverage. Nearly all adults age 65+ have coverage, primarily through government-sponsored Medicare.
- White, non-Hispanics (11.5%) were less likely to be without health care coverage than Hispanics (28.6%), Native Americans (32.9%), and Black/AA adults (34.2%). Small sample size made comparison to and between other groups difficult. If Indian Health Service (IHS) was included, then only seven percent of American Indian adults were without coverage. However, IHS alone is not considered coverage by federal agencies.
- Adults with lower education level or who were or living in households with lower annual income were less likely to have coverage.
- Adults who were unemployed were more likely than employed adults to have coverage. However, nearly 20% of employed adults were without coverage.
- Adults living in Bernalillo County were less likely to be without coverage than those living in the southern regions of New Mexico.

HEALTH CARE ACCESS, IMPACT OF COST

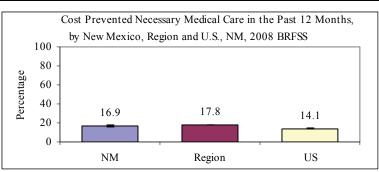

QUESTION:

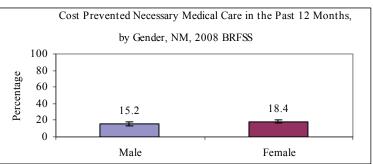

"Was there a time in the past 12 months when you needed to see a doctor but could not because of the cost?"

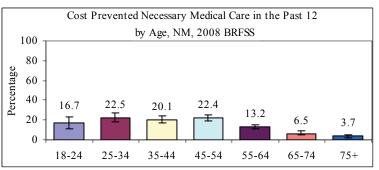

A person's ability and willingness to access health care is influenced by many factors, such as cost, length of time to appointment, distance traveled, and hours that health care offices are open..^{2,3,4,5}

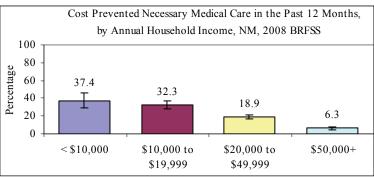

IN NEW MEXICO,

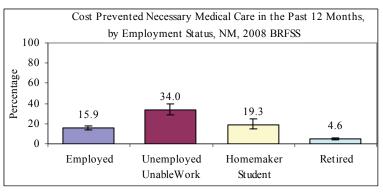

- ♦ In 2008, 16.9% of adult New Mexicans were unable to get needed medical care in the past 12 months because of the cost. This was similar to that of the Region (17.8%) but higher than the percentage for the U.S. (14.1%).
- ♦ Women were more likely to forego needed medical care in the past 12 months because of the cost (18.4%) than were men (15.2%).
- ♦ In spite of a greater need for expensive forms of medical care, cost prevented only 5.2% of adults aged 65 or older from getting necessary medical care while cost prevented 19.3% of adults less than 65 from getting necessary care. Adults age 65 or more qualified for coverage through Federally-funded Medicare. Over 98% of adults aged 65+ had some form of coverage while only about 76% of adults less than age 65 had some form of coverage.
- Hispanic and Native American adults were more likely to forego needed medical care in the past 12 months because of cost (24.0% and 18.9%) than were White, non-Hispanics (10.9%). Small sample sizes made comparison of other groups difficult.
- Adults with lower income or less education or who were unemployed were more likely to forego needed medical care in the past 12 months because of cost.

HEALTH CARE ACCESS, ROUTINE CHECKUP

QUESTION:

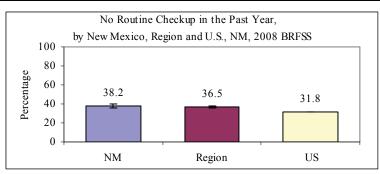

"Do you have one person you think of as your personal doctor or health care provider?"

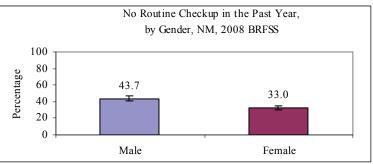

"About how long has it been since you last visited a doctor for a routine checkup?"

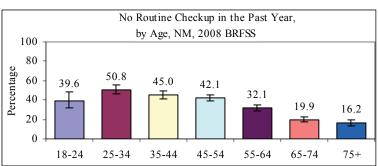

A routine checkup on an annual basis is recommended for effective health maintenance. Routine medical examinations provide opportunities for exchange of information between patient and health care provider, early diagnosis of potentially serious health conditions, and prompt corrective action. Estimates of the proportion of adults obtaining a routine checkup can also serve as one measure of access to health care.^{2,3}

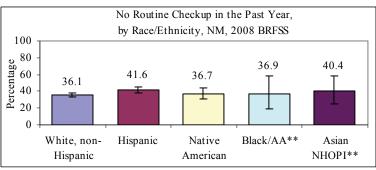

IN NEW MEXICO,

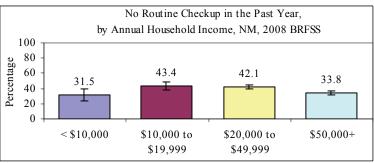

- ♦ A greater percentage of adults in NM (38.2%) and the region (36.5%) had not visited a physician for a routine checkup in the past 12 months than adults in the U.S. (31.8%). Adjusting for differences in the age distributions of these populations did not change this relationship.
- A greater percentage of men had not visited a physician for a routine checkup in the previous 12 months (45.6% and 37.3%, respectively).
- There was not a measurable difference by race/ethnicity, even after adjusting for differences in age distribution of these populations.
- Adults with less than a high school education were less likely to have had a routine checkup in the past year.
- Adults living in households with an annual income greater than \$50,000 were more likely to have had a routine checkup in the past year.
- Adults who reported having a personal health care provider were more likely to report a routine checkup in the past year, even among adults who did not have a health care coverage plan.

IMMUNIZATION

QUESTION:

"During the past 12 months, have you had a flu shot?"

"During the past 12 months, have you had a flu vaccine that was sprayed in your nose?"

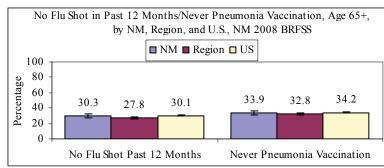

"Have you ever had a pneumonia shot? This shot is usually given only once or twice in a person's lifetime and is different from the flu shot. It is also called the pneumococcal vaccine."

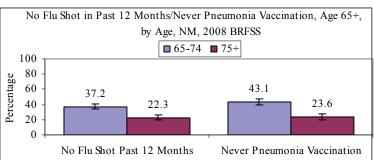

It is recommended that people 65 years of age and older receive a yearly influenza vaccination as part of routine health maintenance. Adults at increased risk of influenza, those with chronic conditions like diabetes, should be vaccinated, as well, regardless of age.

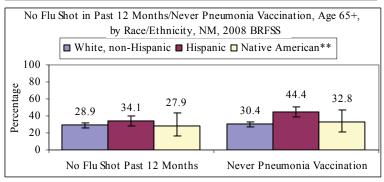

Pneumococcal vaccination is also recommended for adults ages 65 years and older. ⁸ Those at higher risk of the disease include: the elderly, the very young, and those with special health problems such as alcoholism, heart or lung disease, kidney failure, diabetes, HIV, or some types of cancer. ^{6,7}

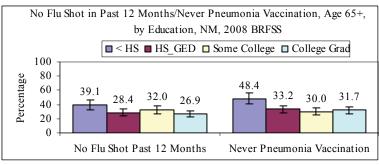

IN NEW MEXICO,

- ♦ 30.3% of New Mexico adults ages 65 years and older had not been immunized against seasonal influenza during the past 12 months and 33.9% had never received the pneumonia vaccine. These percentages were not different from the percentages for the Region.
- ♦ The percentage of adults ages 65 years and older not having been immunized against influenza during the past 12 months was similar for the reported Racial/Ethnic groups, though the small sample in this age range made comparison difficult.
- White, non-Hispanic adults age 65+ were more likely to have received the pneumonia vaccine than Hispanic adults.
- ♦ Adults age 65+ with less than a high school education were less likely to have ever received either the pneumonia vaccine or the seasonal flu vaccine.

- The percentage of New Mexican adults ages 65 years and older not immunized against influenza during the past 12 months was similar across annual household income levels.
- ♦ 34.3% of adults with diabetes, of all ages, had not been vaccinated against influenza in the past 12 months.

MAMMOGRAM W/IN PAST TWO YEARS—WOMEN AGE 50+

QUESTION:

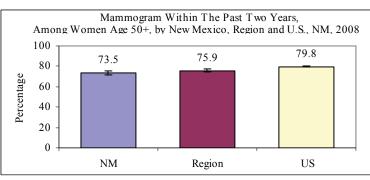

"A mammogram is an x-ray of each breast to look for breast cancer. Have you ever had a mammogram?"

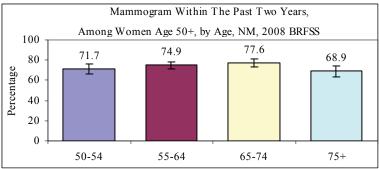

"How long has it been since you had your last mammogram?"

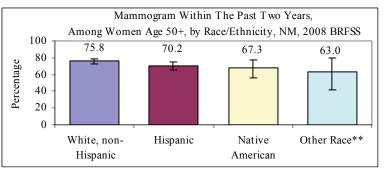

Breast cancer is the most commonly diagnosed cancer among women in New Mexico across all racial/ethnic groups. Breast cancer accounts for one-third of all cancer cases in women, but less than 20 percent of the cancer deaths. The most effective method of detecting early-stage breast cancer is annual or bi-annual mammography. 35

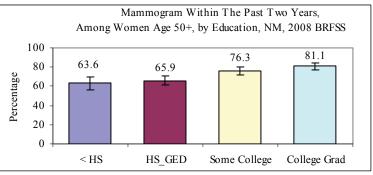

IN NEW MEXICO,

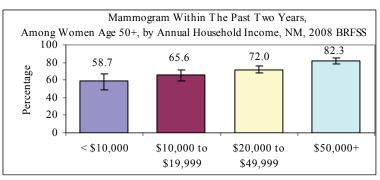

- ♦ 73.5% of women aged 50 or more had a mammogram in the previous 2 years. This percentage was similar to the Region (75.9%) but was lower than the US (79.8%).
- There was no significant difference in history of mammogram by age, race/ethnicity, marital status, employment status, or region of residence, even after adjusting for age differences across groups.
- ♦ Women age 50+ who reported some college education or were a college graduate were more likely to report having had a mammogram in the past 2 years.
- ♦ Women age 50+ living in a household with an annual income of \$50,000 or more were more likely to report having had a mammogram in the past 2 years.
- ♦ Women age 50+ with health care coverage were more likely to report having had a mammogram in the past 2 years.

To For a list of the counties in each geographic region, see Appendix II at the end of this report.

^{**} Estimates based on small sample size may not be reliable and may change significantly from year to year.

PAP TEST W/IN PAST THREE YEARS—WOMEN AGE 18+

QUESTION:

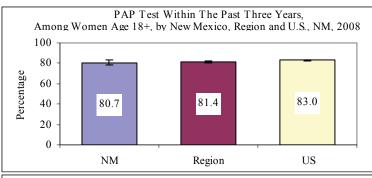

"A Pap test is a test for cancer of the cervix. Have you ever had a Pap test?"

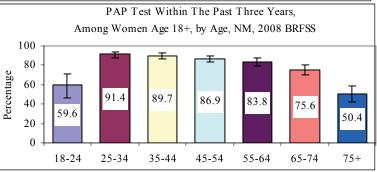

"How long has it been since you had your last Pap test?"

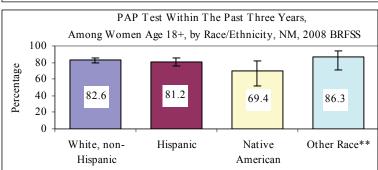

The human papillomavirus (HPV) is the primary cause of cervical cancer. HPV infections are sexually transmitted and risk of infection increases with the number of sexual partners. The Pap test, which detects cellular changes in the cervix, is used to identify women at higher risk for developing cervical cancer.³⁵

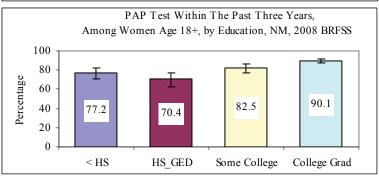

IN NEW MEXICO,

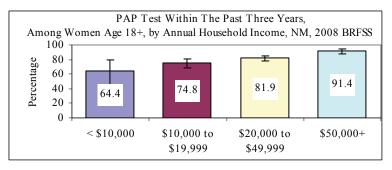

- ♦ 80.7% of women aged 18 or more had a PAP Test in the previous 3 years. This percentage was similar to the Region (81.4%) and to the US (83.0%).
- Women in the youngest and oldest age groups were less likely to report a PAP Test in the past three years than women in the middle age groups.
- ♦ Women who reported some college education or were a college graduate were more likely to report having had a PAP test in the past 3 years.
- ♦ Women living in a household with an annual income of \$50,000 or more were more likely to report having had a PAP test in the past 3 years.
- There was no significant difference by race/ethnicity or region of residence, even after adjusting for age differences across groups.
- Apparent differences by employment status were explained by differences in age across the employment categories.
- Women with health care coverage were not more likely to report having had a PAP test in the past 3 years.

^{*} Those who responded "don't know/not sure", who refused to respond or are male are excluded. Consequently, the sample sizes may not add to 6,227 across some categories for some variables.

^{‡ 95%} of the time, the "true point estimate" will fall between the lower and upper bounds of the 95% Confidence Interval.

To For a list of the counties in each geographic region, see Appendix II at the end of this report.

^{**} Estimates based on small sample size may not be reliable and may change significantly from year to year.

ORAL HEALTH — NO VISIT IN PAST YEAR

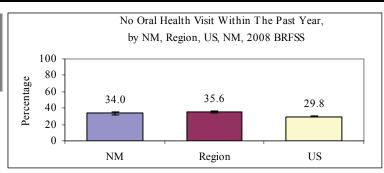

QUESTION:

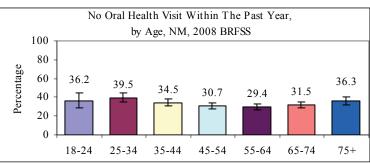

"How long has it been since you last visited a dentist or a dental clinic for any reason? Include visits to dental specialists, such as orthodontists?"

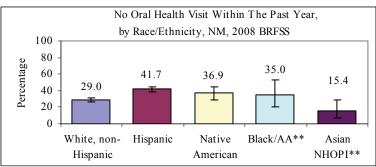

Regular dental visits are important in maintaining good oral health. In addition to care of the teeth and gums, dental visits are important in the early detection and treatment of oral diseases. Even people without teeth need to be monitored regularly for good oral health.

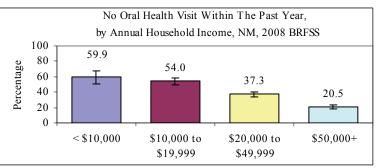

IN NEW MEXICO.

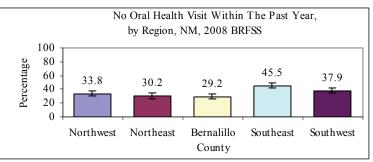

- ♦ 34.0% of adult New Mexicans had not visited a dentist in the past year. This percentage was not statistically different from the Region (35.6%) but was higher than the U.S. (29.8%).
- There was not a statistically significant difference between men and women.
- White, non-Hispanic adults were more likely to have visited a dentist in the past year than Hispanic adults and Asian/NHOPI adults were more likely to have visited a dentist in the past year than Native American adults. Comparison of other groups was limited by small sample size. Group differences in income and education status may explain some of the differences by race/ethnicity.
- ♦ Income was associated with dental visits. Over 50% of adults living in households with an annual income less than \$20,000 per year had not visited a dentist in the past year.
- ♦ Education was also associated with dental visits. 50.7% of adults with less than a high school education had not visited a dentist in the past year while 22.4% of adults with a college degree had not visited a dentist in the past year.
- Adults living in the Southeast and Southwest regions of NM were less likely to have visited a dentist in the past year.

ORAL HEALTH — ONE OR MORE EXTRACTIONS DUE TO DECAY

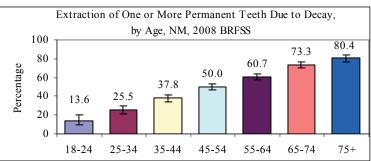

QUESTION:

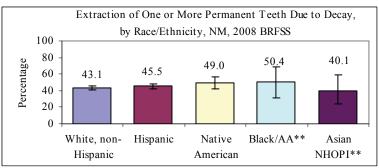

"How many of your permanent teeth have been removed because of tooth decay or gum disease? Include teeth lost to infection, but do not include teeth lost for other reasons, such as injury or orthodontics. (If wisdom teeth are removed because of tooth decay or gum disease, they should be included in the count for lost teeth) "

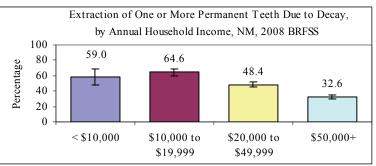

IN NEW MEXICO,

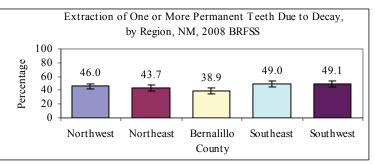

- ♦ 44.4% of adult New Mexicans had experienced the extraction of at least one tooth due to decay or gum disease. This percentage was not statistically different from the Region (42.8%) or that of the U.S. (45.1%).
- ♦ There was not a statistically significant difference between men and women.
- Perhaps not surprising was a strong association between age and history of extraction.
- There was no measurable difference by race/ethnicity.
- ♦ Income was associated with extraction of one or more teeth. Just over 60% of adults living in households with an annual income less than \$20,000 per year had lost at least one tooth to decay or gum disease while 33% living in households with income of \$50,000+ had lost one or more teeth.
- ♦ Education was also associated with extraction of one or more teeth. 61% of adults with less than a high school education had lost at least one tooth while 34% of adults graduating from college had lost one or more teeth.
- ♦ The Northwest and Northeast regions of the state and Bernalillo County were all similar, while a greater percentage of adults living in the Southwest and Southeast regions had lost at least one tooth than adults living in Bernalillo County.

COLORECTAL CANCER SCREENING, ADULTS AGE 50+

QUESTION:

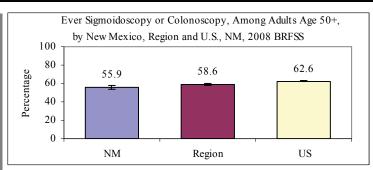

"Sigmoidoscopy and colonoscopy are exams in which a tube is inserted in the rectum to view the colon for signs of cancer or other health problems. Have you ever had either of these exams?"

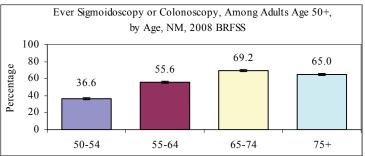

"For a SIGMOIDOSCOPY, a flexible tube is inserted into the rectum to look for problems. A COLONOSCOPY is similar, but uses a longer tube, and you are usually given medication through a needle in your arm to make you sleepy and told to have someone else drive you home after the test. Was your MOST RECENT exam a sigmoidoscopy or a colonoscopy?"

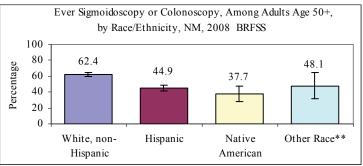

Colorectal cancer is the fourth most frequently diagnosed form of cancer but the second leading cause of cancer deaths among New Mexico adults. Screening can reduce mortality from this disease. Additionally, colorectal cancer screening can prevent this cancer from occurring through the removal of pre-cancerous polyps. 35

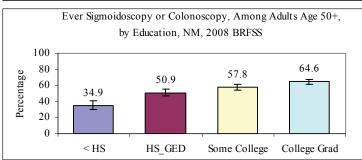

IN NEW MEXICO,

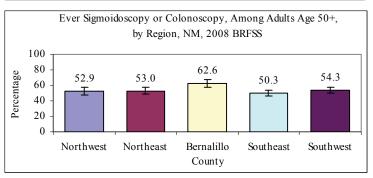

- ♦ 55.9% of New Mexico adults age 50+ have had either a sigmoidoscopy or colonoscopy, at least once, which was similar to the region (58.6%). NM and the region were lower than the U.S. (62.6%).
- ♦ White, non-Hispanic adults (62.4%) were more likely than Hispanic adults (44.9%) and Native American adults (37.7%). Adjusting for differences in age across the groups did not change this relationship.
- ♦ Though recommended for adults age 50 or older, adults age 50 64 were less likely to have had a colorectal cancer test than those age 65+, nearly all of whom are covered by Medicare.
- Adults with a higher level of education or who lived in households with higher annual household income were more likely to have had a sigmoidoscopy or colonoscopy.
- ♦ Health care coverage was a determining factor in whether an adult age 50+ had either procedure. While 60.0% of those with health care coverage reported a sigmoidoscopy or colonoscopy, only 17.7% of those who did not have coverage reported either procedure.
- ♦ 90.0% of those reporting a procedure indicated that it was a colonoscopy. However, among adults age 50 to 64, those without health care coverage were more likely to have had a sigmoidoscopy.

^{**} Estimates based on small sample size may not be reliable and may change significantly from year to year.

HIV TEST HISTORY

QUESTIONS:

"Have you EVER been tested for HIV?"

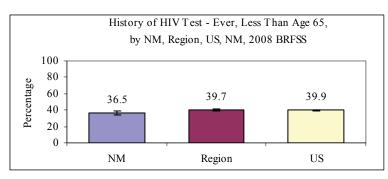

"Where did you have your last HIV test,...?"

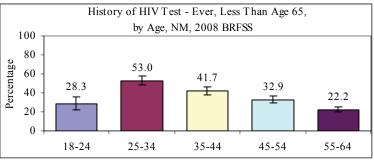

"Was it a rapid test where you could get your results within a couple of hours?"

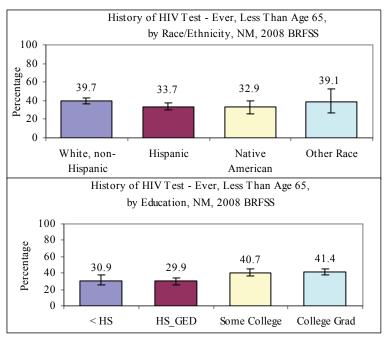

In New Mexico, AIDS cases have been tracked since 1981 and cases of HIV infection have been tracked since 1998. Through the end of 2008, a total of 3,775 cases of HIV infection had ever been reported in the state. Among the cases reported in New Mexico across all years, the most prevalent risk factor category was men having sex with men, followed by injection drug use.

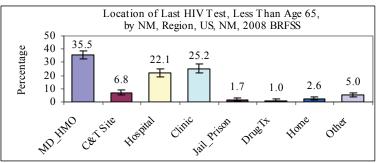

IN NEW MEXICO,

- ♦ 36.8% of adults age 18 to 64 reported a history of at least one test for HIV infection, which was slightly lower than the region (39.7%) and the U.S. (39.9%).
- ♦ History of HIV testing was most likely among those 25 to 34 years of age. The relatively low testing rate among 18 to 24 year olds may be partially explained by the "Ever" nature of the question, older adults having had greater opportunity to be tested, but any possibility that young adults perceive themselves to be at low risk of HIV infection should be explored.
- ♦ History of HIV testing was more common among adults with more education.
- Hispanic and Native American adults were less likely to have been tested than White, non-Hispanics. The sample sizes of other groups were too small in 2008 to report separate estimates. In 2007, Black/African American adults were most likely to report having been tested for HIV.
- Primary care providers, clinics, and hospitals were most frequently reported as the testing site.
- Of HIV tests obtained in the previous year, 17.7% were performed using a 'rapid' HIV test.

CURRENT DIAGNOSED ASTHMA

QUESTIONS:

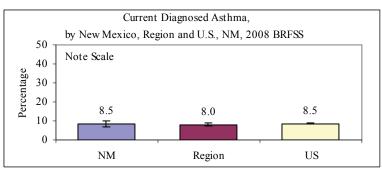

"Have you ever been told by a doctor, nurse or other health professional that you had asthma?"

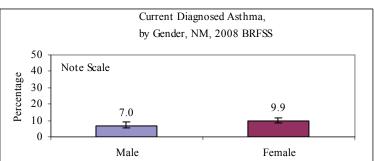

"Do you still have asthma?"

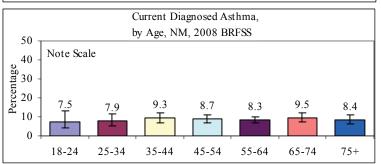

Asthma is a chronic respiratory disease characterized by episodes or attacks of inflammation and narrowing of small airways. Asthma attacks can vary from mild to life threatening. Symptoms can include shortness of breath, cough, wheezing, and chest pain or tightness. The burden from asthma in the United States has increased over the past 2 decades. Nationally, in 2008, an estimated 16,380,000 adults had asthma.¹¹

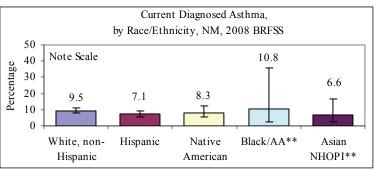

IN NEW MEXICO,

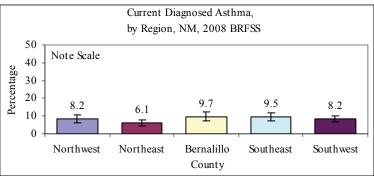

- ♦ 8.5% of New Mexicans currently had asthma at the time of the interview. This percentage was not statistically different from the Region (8.0%) or the U.S. (8.5%).
- ♦ The percentage of women who currently had asthma (9.9%) was higher than that of men who currently had asthma (7.0%).
- Adults who were unable to work were more likely to report current asthma than those who were employed, retired, homemaker, or a student.
- The prevalence of current asthma did not vary by age, race/ethnicity, education level, annual household income, marital status, or by region of residence.
- Current smokers were not more likely than non-smokers to report current asthma.
- Adults with current asthma were nearly two and half times more likely than adults without asthma to report their general health to be fair or poor.
- Adults with current asthma were more than two times more likely than adults without asthma to report a disability.

CARDIOVASCULAR DISEASE — ADULTS AGE 50+

QUESTION:

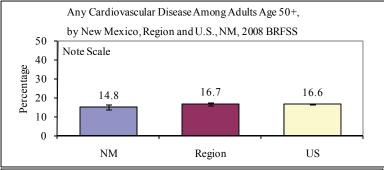

- "Has a doctor, nurse, or other health professional ever told you that you had any of the following:
- ...a heart attack, also called a myocardial infarction? ...angina or coronary heart disease?
- ...a stroke?

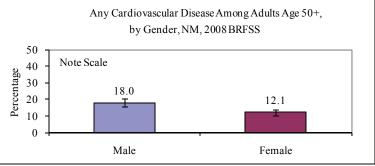

Heart disease is the leading cause of death for both men and women in the United States. ¹² It is also one of the leading causes of disability in the United States. Stroke is the third leading cause of death in the United States. ¹³

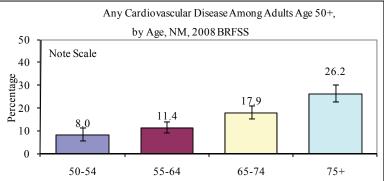

Health conditions such as high blood cholesterol levels, high blood pressure, obesity, and diabetes mellitus can increase the risk of cardiovascular disease. Behavioral factors, including tobacco and alcohol use, diet high in saturated fat and cholesterol, and physical inactivity, may also increase the risk of development of cardiovascular disease. ¹⁴

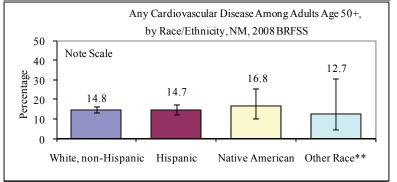

IN NEW MEXICO AMONG ADULTS AGE 50+,

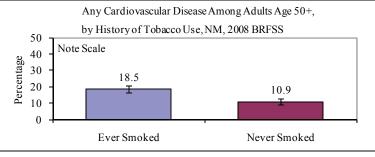

- ♦ 14.8% report history of either myocardial infarction, coronary heart disease, or stroke. The NM estimate of cardiovascular disease was statistically lower than that of the Region (16.7%) and that of the U.S (16.6%).
- There was no measurable difference by race/ ethnicity. Small sample size combined with the generally low prevalence of cardiovascular disease prohibited presentation of estimates for some race groups.
- Adults with less education or income were more likely to report cardiovascular disease.
- Men were nearly two times more likely than women to report a history of myocardial infarction and coronary heart disease but there was no difference for stroke.
- Adults reporting cardiovascular disease were three times more likely to report that they were unable to work.
- Current and former smokers were more likely to report cardiovascular disease, particularly MI and stroke, than adults who never smoked.

CARDIOVASCULAR DISEASE — ADULTS AGE 50+

Table 33. Percentage of Adults age 50+ who had EVER been told that they'd had either a myocardial infarction, coronary heart disease, or a stroke, New Mexico, 2008.

^{**} Estimates based on small sample size may not be reliable and may change significantly from year to year.

CARDIOVASCULAR DISEASE — ADULTS AGE 50+

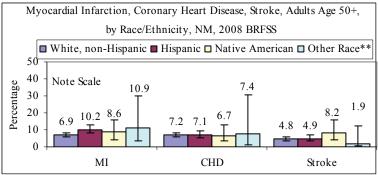

IN NEW MEXICO AMONG ADULTS AGE 50+,

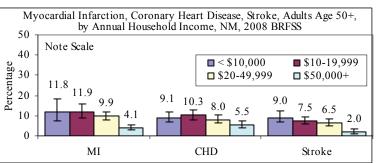

- ♦ 7.9% in NM report history of myocardial infarction, 9.1% history of coronary heart disease, and 4.9% history of stroke. The NM estimate of coronary heart disease was statistically lower than that of the Region and that of the U.S.
- Men were nearly two times more likely than women to report a history of myocardial infarction and CHD but there was no difference for stroke
- ♦ There was a clear association between age and cardiovascular disease. Adults age 65 or more were more likely to report each form of cardiovascular disease than adults age 50-64.
- There was no measurable difference by race/ethnicity. Small sample size combined with the generally low prevalence of cardiovascular disease prohibited presentation of estimates for other race groups.
- Adults with less education and lower annual household income were more likely to report one or more forms of cardiovascular disease.
- Adults with diabetes were more likely to report history of CHD.
- Ability to work and cardiovascular disease: Adults with history of myocardial infarction alone were more than two times as likely to be unable to work as those with no history of cardiovascular disease. Adults with history of stroke alone were five times as likely to be unable to work as those with no history of cardiovascular disease. Adults with history of multiple cardiovascular disease outcomes were four times as likely to be unable to work as those with no history of cardiovascular disease.

[§] For a discussion of the reasons for using weighted estimates, see Appendix I at the end of this report.

^{*} Those who responded "don't know/not sure" or who refused to respond were excluded. Consequently, the sample sizes may not add to 6,227 across some categories for some variables.

^{‡ 95%} of the time, the "true point estimate" will fall between the lower and upper bounds of the 95% Confidence Interval.

For a list of the counties in each geographic region, see Appendix II at the end of this report.

^{**} Estimates based on small sample size may not be reliable and may change significantly from year to year.

DIABETES

QUESTION:

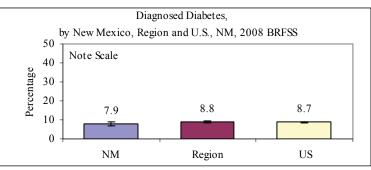

"Have you ever been told by a doctor that you have diabetes?"

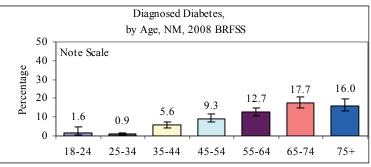

Diabetes Mellitus (DM) is a group of diseases characterized by high levels of blood glucose resulting from insufficient insulin production, insulin action, or both. Diabetes can be associated with serious complications including cardiovascular disease, end-stage renal disease, blindness, amputation, and premature death, but people with diabetes can take steps to control the disease and lower the risk of complications.¹⁵

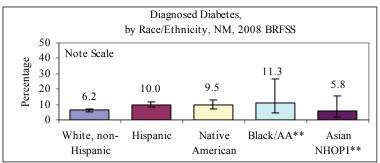

For more information, see the Diabetes Prevention & Control Program website: http://www.diabetesnm.org/index.htm

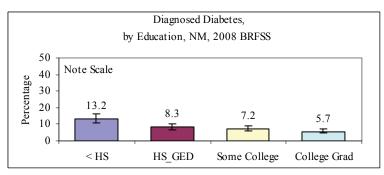

IN NEW MEXICO.

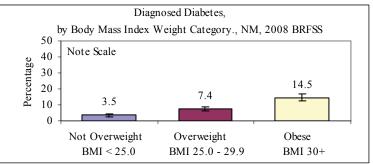

- ♦ The percentage of adults in New Mexico with diabetes was 7.9%. After adjusting for differences in age distribution, the NM rate was lower than that of the Region (8.8%) but similar to that of the U.S. (8.7%).
- After adjusting for differences in age distribution, Hispanic and Native American adults were more likely to report a diagnosis of diabetes than White, non-Hispanic adults. Small sample size prevented effective comparison of other groups.
- Adults with lower education and less income were more likely to report having diabetes.
- Adults who were obese had the highest prevalence of diabetes (14.5%), followed by overweight but not obese individuals (7.4%), and then followed by those who were not overweight or obese (3.5%).
- ♦ 52.0% of adults with DM had received all recommended prevention services in the past year. However, adults with DM who did not have health care coverage were nearly two and a half times more likely to report not having received all prevention services than those who had health care coverage.

DISABILITY

QUESTIONS:

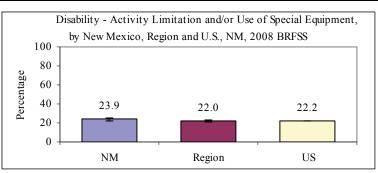

"Are you limited in any way in any activities because of physical, mental, or emotional problems?"

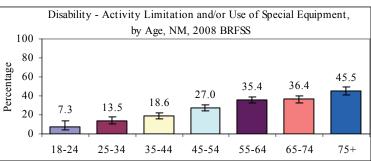

"Do you now have any health problem that requires you to use special equipment, such as a cane, a wheelchair, a special bed, or a special telephone?"

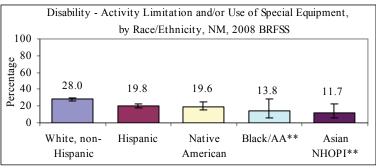

Here, respondents answering "Yes" to either or both of the above questions were considered to have a disability.

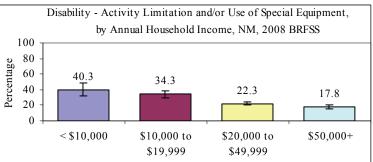

IN NEW MEXICO,

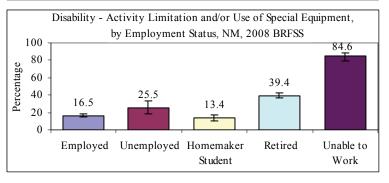

- ♦ 23.9% of New Mexicans indicated having a disability. This was similar than that of the Region (22.0%) and the U.S. (22.2%).
- There was no difference between men and women.
- Adults in older age groups were more likely to report having a disability. Over 45% adults age 75 or more reported a disability.
- White, non-Hispanics were more likely to report having a disability (24.9%) than Hispanics (15.8%) and Native Americans (17.1%). After adjustment for age, only the difference between White, non-Hispanics and Hispanics remained. Small sample size prevented effective comparison of the remaining groups.
- The percentage of adults who indicated having a disability was highest among those living in a household with an annual income below \$20,000.
- There was no difference in the prevalence of disability by education status.
- Nearly 85% of adults who were unable to work had some form of disability. After controlling for age and annual household income, the odds of being unable to work were seventeen times greater for adults with a disability than for those without a disability.

DISABILITY

QUESTIONS:

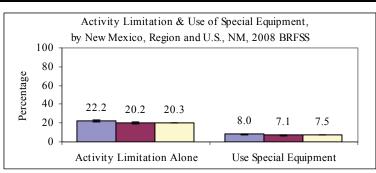

"Are you limited in any way in any activities because of physical, mental, or emotional problems?"

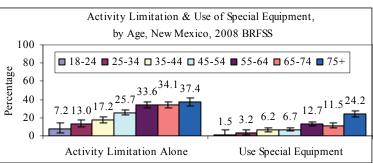

"Do you now have any health problem that requires you to use special equipment, such as a cane, a wheelchair, a special bed, or a special telephone?"

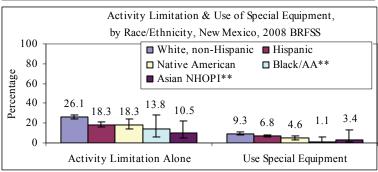

Here, responses to the two questions are presented separately.

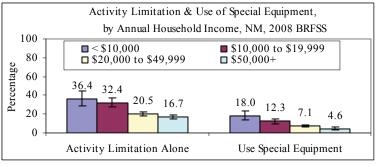

IN NEW MEXICO,

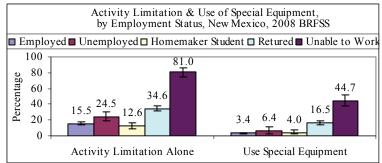

- ♦ 22.2% of adult New Mexicans were limited in activities due to some physical, mental, or emotional problem. This was statistically similar to that of the Region (20.2%) but slightly lower than that of the U.S. (20.3%).
- ♦ 8.0% of adult New Mexicans had a health problem requiring the use of special equipment. This was similar to that of the region (7.1%) and the U.S. (7.5%).
- There was no difference between men and women for either measure.
- Adults in older age groups were more likely to report having a disability or needing special equipment.
- After adjustment for age, there was no difference by race/ethnicity for either activity limitation or need for special equipment.
- Adults who lived in a household with an annual income of \$20,000 or likely to limited in their activities or to need special equipment than those living in household with an annual income less than \$20,000. Both measures did not vary by education status.
- Adults reporting an activity limitation or needing special equipment were considerably more likely to report being unable to work.

FALLS & FALLS WITH INJURY — ADULTS AGE 45+

QUESTION:

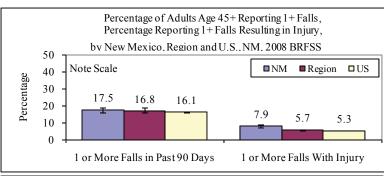

"In the past 3 months, how many times have you fallen?"

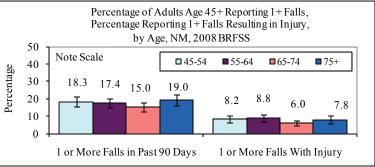

"How many of these falls caused an injury? By an injury, we mean the fall caused you to limit your regular activities for at least a day or to go see a doctor."

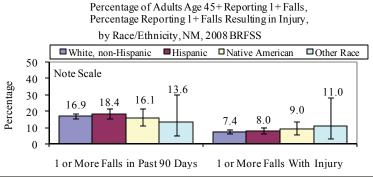

The two questions about falls were asked only of adults age 45 or more.

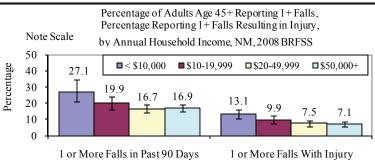

IN NEW MEXICO.

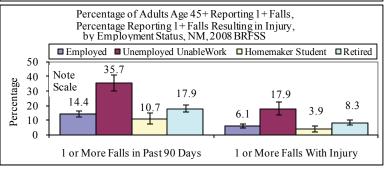

- ♦ 17.5% of adults in New Mexico had fallen at least once in the previous 90 days.. This percentage was similar to the percentages for the Region (16.8%) and the U.S. (16.1%).
- ♦ Just under 8% of adults in New Mexico had suffered at least one fall with an injury in the previous 90 days. This was higher than both the region (5.7%) and the U.S. (5.3%). Though New Mexico adults were not more likely to fall than adults elsewhere, New Mexico adults were more likely to be injured in a fall.
- Adults in older age groups were not more likely to fall or to be injured in a fall than adults in younger 45+ age groups..
- There was no clear difference in risk of falls or risk of injury across race/ethnic groups.
- ♦ Adults age 45+ who lived in households earning less than \$10,000 per year were more likely to fall and were more likely to be injured in a fall than those living in households earning \$20,000 or more per year.
- History of falls and falls with injury did not vary with education level.
- Adults who were unemployed or were unable to work were more likely to report a fall and a fall with injury than other adults.
- There was no difference in history of falls or falls with injury by region within NM.

OVERWEIGHT AND OBESITY

QUESTIONS:

"About how much do you weigh without shoes?"

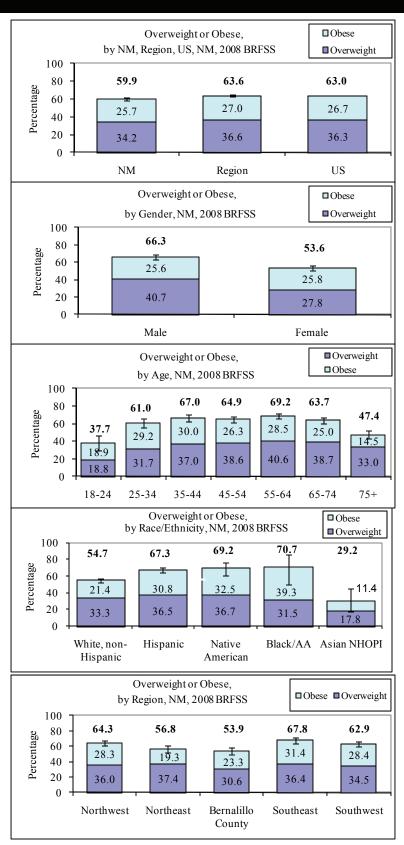

"About how tall are you without shoes?"

Being overweight or obese is a known risk factor for diabetes, heart disease and stroke, hypertension, gallbladder disease, osteoarthritis (degeneration of cartilage and bone of joints), sleep apnea and other breathing problems, and some forms of cancer (uterine, breast, colorectal, kidney, and gallbladder).²⁰

Body Mass Index (BMI) is the measurement of choice for many obesity researchers and other health professionals. BMI is based on height and weight and is not gender-specific. BMI = weight in pounds x 704.5/(height in inches)². Overweight is defined as a BMI of 25-29.9, and obesity as a BMI of 30 or greater.²⁰ The confidence intervals presented in these charts are associated with the over-all Overweight/Obese measure in bold text above each bar.

IN NEW MEXICO,

- ♦ 59.9% of the adults were either overweight or obese: 34.2% of adults were overweight and an additional 25.7% were obese, based on Body Mass Index (BMI). These percentages were not statistically different from those of the Region (36.6% and 27.0%) or the U.S. (36.3% and 26.7%).
- Men were more likely to be overweight than women, 40.7% versus 27.8%, but men and women were similar in terms of obesity.
- High rates of overweight and obesity were common to all racial/ethnic groups. Hispanics and Native Americans were more likely to be obese than White non-Hispanics and Asian/NHOPI. Asian/ NHOPI adults were less likely to be overweight or obese than adults of any other group.
- Residents of the Southeast region were more likely to be obese than residents of the Northeast or Bernalillo County.

♦ Adults with a college education were less likely to be obese.

 $[\]S$ For a discussion of the reasons for using weighted estimates, see Appendix I at the end of this report.

^{*} Those who responded "don't know/not sure", who refused to respond, or were males were excluded. Consequently, the sample sizes may not add to 6,227 across some categories for some variables.

^{‡ 95%} of the time, the "true point estimate" will fall between the lower and upper bounds of the 95% Confidence Interval.

[☼] For a list of the counties in each geographic region, see Appendix II at the end of this report.

^{**} Estimates based on small sample size may not be reliable and may change significantly from year to year.

TOBACCO USE

QUESTIONS:

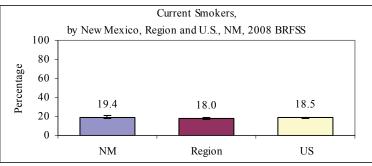

"Have you smoked at least 100 cigarettes in your entire life?"

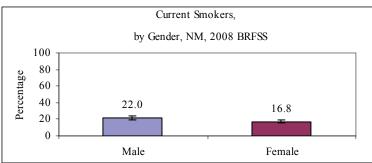

"Do you now smoke cigarettes every day, some days, or not at all?"

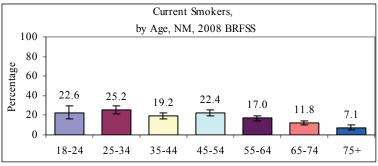

Smoking and chewing tobacco have been shown to be risk factors for lung, oral, bladder, kidney, and pancreatic cancer, as well as for cardiovascular disease, particularly stroke. BRFSS defines current smokers as respondents who have smoked at least 100 cigarettes and now report smoking "Every Day" or "Some Days".

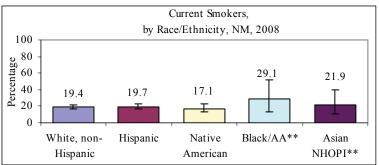

IN NEW MEXICO,

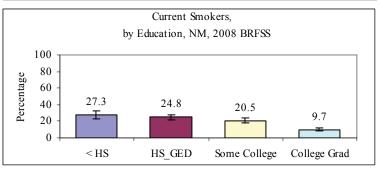

- ♦ 19.4% of New Mexico adults were current smokers, which was not statistically different from the Region (18.0%) or the U.S. (18.5%).
- The prevalence of current smoking was fairly stable through age 54 but was lower within each successive age group above age 54.
- There was no measurable difference in the prevalence of smoking between the different racial/ethnic groups, even after adjusting for differences in the age distributions of the different groups.
- The prevalence of smoking was highest among those with the lowest education and income.
- ♦ 58.4% of adult smokers tried to quit smoking at least once during the past year. This was not statistically different from the percentages for the Region (58.6%) and the U.S. (58.2%), even after adjusting for differences in age distribution.
- Current smokers were more likely than non-smokers to describe their general health as Fair or Poor, to report a history of cardiovascular disease (among adults age 50+), or to have been unable to do their usual activities in the past 30 days due to poor physical or mental health.

^{*} Those who responded "don't know/not sure", who refused to respond or were male were excluded. Consequently, the sample sizes may not add to 6,227 across some categories for some variables.

^{‡ 95%} of the time, the "true point estimate" will fall between the lower and upper bounds of the 95% Confidence Interval.

[☼] For a list of the counties in each geographic region, see Appendix II at the end of this report.

^{**} Estimates based on small sample size may not be reliable and may change significantly from year to year.

ALCOHOL CONSUMPTION

QUESTIONS:

A drink of alcohol is 12-ounce beer, a 5-ounce glass of wine, or a drink with one shot of liquor.

"During the past 30 days, how many days per week or per month did you have at least 1 drink of any alcoholic beverage?"

"During the past 30 days, on the days when you drank, about how many drinks did you drink on the average?"

"Considering all types of alcoholic beverages, how many times during the past 30 days did you have (5 (men) or 4 (women)) or more drinks on an occasion?"

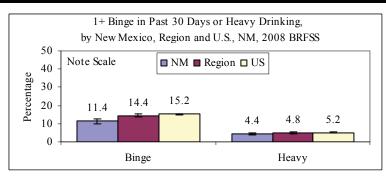

"During the past 30 days, how many times have you driven when you've had perhaps too much to drink?"

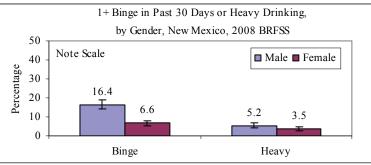

Excessive alcohol consumption is a contributing factor to morbidity and mortality from many causes. Acute binge drinking (defined as 5 or more drinks for males and 4 or more drinks for females on at least one occasion during the past month) is strongly associated with injuries and death from motor vehicle crashes, homicide, suicide, falls and drug overdose. Chronic 'heavy' drinking (defined as > 2 drinks per day for men and > 1 drink per day for women on average during the past month) is strongly associated with numerous alcohol-related diseases, most notably alcohol-related chronic liver disease. Strongly associated with alcohol-related chronic liver disease.

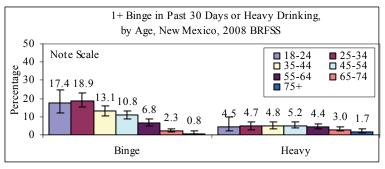

Though the rate of binge drinking was lower in NM than the region and the nation and chronic drinking was lower in NM than the nation, over the past 20 years, New Mexico has consistently had among the highest alcohol-related death rates in the United States.

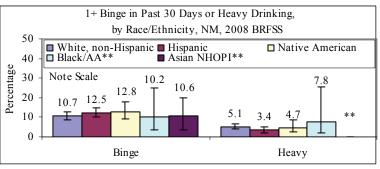

IN NEW MEXICO,

- ♦ 11.4% of New Mexico adults reported binge drinking in the past 30 days which was lower than the Region (14.4%) and the nation (15.2%).
- ♦ 4.4% of New Mexico adults reported heavy drinking, which was similar to that of the region (4.8%) but lower than that of the U.S. (5.2%).
- The percentage of males who reported binge drinking (16.4%) was higher than the percentage for females (6.6%).

- Binge drinking and heavy drinking were lower among older adults.
- ♦ There was no measurable difference in binge or heavy drinking by race/ethnicity, education level, income, or region of residence. Small sample size made comparison of some groups difficult.

ALCOHOL CONSUMPTION — MALES

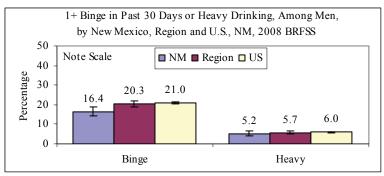

The relationship of drinking behavior to demographic factors follows similar patterns between men and women but the magnitude is quite different. Males have roughly twice the alcohol-related death rates of females, in both the United States and in New Mexico.^{24,25}

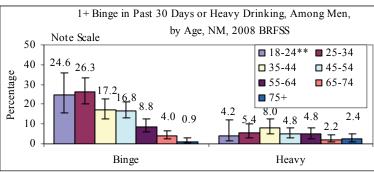

These differences are driven in part by differences in the prevalence of excessive alcohol consumption. Among males, binge drinking is defined as 5 or more drinks on at least one occasion during the past month; and heavy drinking is defined as drinking more than 2 drinks per day on average during the past month.

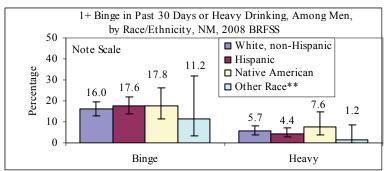

In 2008, men were more likely to have binged in the past 30 days and were more likely to report heavy drinking (even though the definitions of binge and heavy drinking attempt to adjust for differing body mass and metabolism by sex).

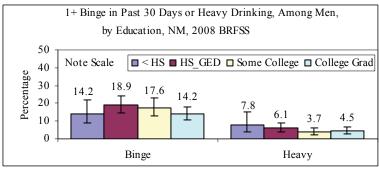

IN NEW MEXICO.

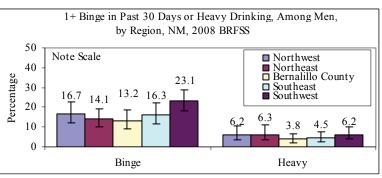

- ♦ 16.4% of New Mexico adult males reported binge drinking in the past 30 days which was less than bordering states (Region, 20.3%) and the U.S. (21.0%).
- ♦ 5.2% of New Mexico adult males reported heavy drinking, which was similar to the region (5.7%) and the U.S. (6.0%).
- Among males, binge drinking was highest among those 18-34 years old and was much lower among older adults. For heavy drinking there was no clear association with age.
- Apparent differences in binge and heavy drinking by race/ethnicity were not statistically significant.
- Adjusting for age, adult males who were divorced or separated were more likely to report binge drinking than those who were married. There was no difference in heavy drinking by marital status.
- Apparent differences in binge and heavy drinking by education status were not statistically significant.

 $^{^{\}Psi}$ Among Males, 90% were students.

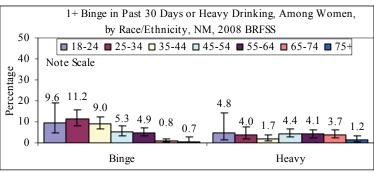

ALCOHOL CONSUMPTION — FEMALES

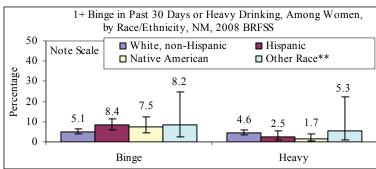

Among females, binge drinking is defined as 4 or more drinks on at least one occasion during the past month; and heavy drinking is defined as drinking more than 1 drink per day on average during the past month.

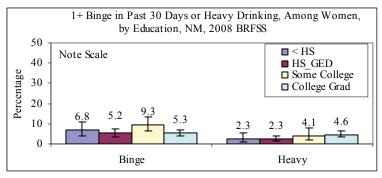

IN NEW MEXICO,

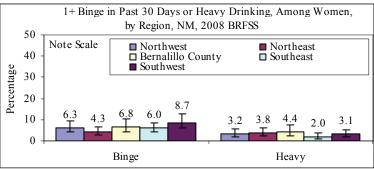

- ♦ 6.6% of New Mexico adult females reported binge drinking in the past 30 days which was similar to bordering states (Region, 8.7%) but lower than the U.S. (9.7%).
- ♦ 3.5% of New Mexico adult females reported heavy drinking, which was similar to bordering states (Region, 3.8%) but lower than the U.S. (4.4%).
- Binge drinking was lower among older women.
- Apparent differences in binge drinking by race/ethnicity were not statistically significant. Small sample size made comparison difficult. There was no difference in heavy drinking among females by race/ ethnicity.
- There was no statistically measureable difference in either binge drinking or heavy drinking by education status.
- There were no differences by region of residence within the state for either binge or heavy drinking.

NO LEISURE-TIME PHYSICAL ACTIVITY IN PAST 30 DAYS

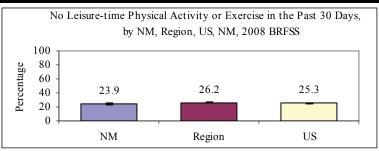

QUESTION:

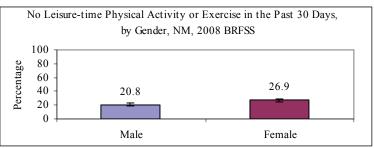

"During the past month, other than your regular job, did you participate in any physical activities or exercises such as running, calisthenics, golf, gardening, or walking for exercise?"

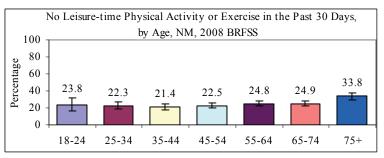

Among the health benefits of regular physical activity are reduced risk of coronary heart disease, lower heart rate and blood pressure, reduced weight, lower serum triglyceride levels, increased "good" cholesterol, reduced risk of osteoporosis by increasing bone density, boosting of immune function, beneficial effect on clotting mechanisms and improved psychological well-being and quality of life. 26

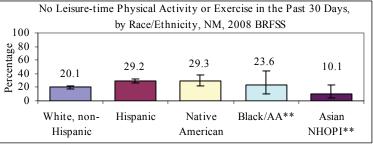

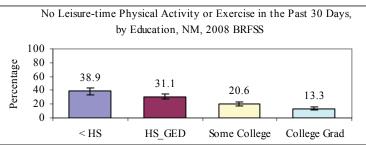

- ♦ 23.9% of New Mexicans did not engage in any leisure-time activities or exercise during the past 30 days. This percentage was lower than the percentage for the Region (26.2%) and that of the U.S. (25.3%).
- ♦ Adult females (26.9%) were less likely to have engaged in leisure-time physical activity than adult males (20.8%), even after adjusting for differences in age distribution.
- Adults age 65 or more were less likely to engage in leisure-time activities than adults of younger age groups.
- ♦ Hispanics (29.2%) were more likely than Asian/NHOPI (10.1%) or White, non-Hispanics (20.1%) to report no leisure-time activities or exercise during the past 30 days. All groups could benefit from increased leisure-time activity.
- Adults with less income and lower education level were less likely to have engaged in any leisure-time activities or exercise in the past 30 days.
- ♦ Adults residing in the Southeast region of the state were less likely to have engaged in any leisure-time activities than those of the northern regions or Bernalillo County, and, after adjusting for differences in age distribution, less likely to have engaged in any leisure-time activity than residents of the Southwest region (24.6%).

RISK OF HIV INFECTION

QUESTION:

"...please tell me if any of the situations apply to you.

You do not need to tell me which one:

You have used intravenous drugs in the past year; you have been treated for a sexually transmitted or venereal disease in the past year.;

you have given or received money or drugs in exchange for sex in the past year;

you had anal sex without a condom in the past year.

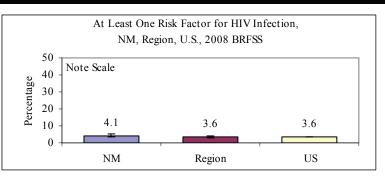

Do any of these situations apply to you? "

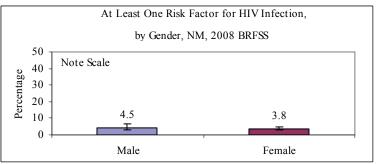

The primary risk factors for infection with HIV transmission include heterosexuals with multiple sex partners, injection-drug use, and men having sex with other men.¹⁰

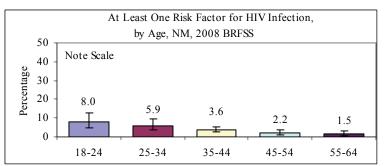

The wording of this question differed from that of recent years in which interest was focused on risk of Hepatitis B and HIV infection. Though the risk factors for the two viruses are similar, results for 2008 should not be compared to those of recent years.

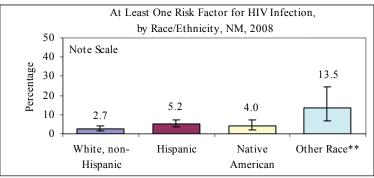

IN NEW MEXICO

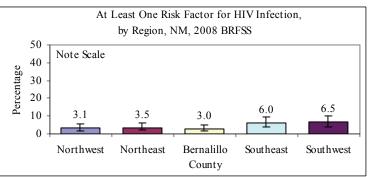

- ♦ 4.1% of adults reported one or more risk factors for HIV infection. This percentage was not different from the percentage for the Region (3.6%) or that of the U.S (3.6%).
- There was no measurable difference between males and females.
- Reporting of risk for HIV infection was highest among those in the younger age groups.
- There was no measurable difference in reporting of risk factors by race/ethnicity or education level.
- Adults in the highest income category were less likely than those in the next bracket to report one or more risk factors. There was no measurable differences between other income groups.
- Adults reporting at least one risk factor were more likely to report having been tested for HIV infection but less than half of those reporting one or more risk factors reported having been tested for HIV infection.

APPENDICES

APPENDIX I—METHODS

The 2008 Behavioral Risk Factor Surveillance System (BRFSS) was conducted using random telephone survey methods. One implication of this survey method is that individuals living in households without landline telephones were not included in the survey sample and so are not represented in the results presented here. Households using only cell phones or not having any phone at all were excluded. Nationally, approximately 82.0% of households subscribed to landline telephone service in 2007. Telephone coverage varies considerably from county to county within the state. For example, the 2000 U.S. Census showed the proportion of households without landline telephone coverage was 2.5% for Bernalillo County and 31.6% for McKinley County, respectively. Use of cell phones as the exclusive form of telephone service has been increasing dramatically in recent years, as demonstrated by the chart on the following page.

Interviews were performed at computer workstations using Ci3 computer-aided telephone interviewing software provided by Sawtooth Software, Inc. The sample frame of all possible landline telephone numbers comes from the Telecordia Technologies database and was provided by Genesys Telecommunications Laboratories, Inc.

Calls were made during several time periods throughout the day, in order to maximize the chance of finding randomly selected respondents at home. The calling periods for the BRFSS in 2008 were:

Daytime: 10-3 Monday-Friday
Evening: 4-9 Monday-Friday
Weekends: 10-3 Saturday, 1-6 Sunday

Approximately 1/12 of the annual sample was surveyed each month to avoid bias in the results due to possible seasonal variation.

Sample Selection

Households were chosen at random from all households in the state with landline telephones, using a disproportionate stratified sampling (DSS) design. One adult respondent was randomly selected from all adults ages 18 and older living in the randomly selected household. The final 2008 sample size was 6,227.

DSS, as implemented in the BRFSS beginning in 2003, telephone numbers were drawn from two strata (lists) that were based on the presumed density of known telephone household numbers. In this design, telephone numbers were classified into strata that are either high density (**listed 1+ block** telephone numbers) or medium density (**not listed 1+ block** telephone numbers) to yield residential telephone numbers. Telephone numbers in the high density stratum were sampled at the highest rate, resulting in a higher "hit rate", i.e., more of the randomly selected telephone numbers were household numbers, thereby reducing the cost of the survey.

Once a residential household was selected, a respondent was randomly selected from among all adults ages 18 and over living in the household. After the interview was completed, the last two digits of the phone number were dropped from the record. The entire telephone number was dropped from the final database to preserve the respondent's anonymity. Last names, Social Security Numbers, and addresses were not collected and so were not included in the record. If a randomly selected adult was not available at the time of the call, interviewers attempted to set an appointment for call-back. In households with multiple adults, the first name of the randomly selected adult was requested and temporarily recorded in order to facilitate interview of the appropriate adult at the time of the call-back. This portion of the record was dropped at the close of the monthly survey and was never transmitted to the CDC.

APPENDIX I—METHODS

Sources of Error

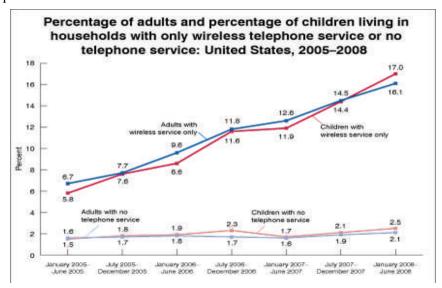

Like any estimates produced from population surveys, the estimates produced from the BRFSS are subject to error. The information presented below was abstracted from two sources: the BRFSS User's Guide³³ and an article from the Journal of the American Statistical Association.³⁴

Sampling error results because the estimates are based on a sample of the population. Since only a subset of the population of interest responds to the questions, different samples yield different estimates. This type of error occurs in even the most sophisticated sampling design. However, since the estimates are based on a probability sample, the amount of sampling error in the estimates can be estimated and is reflected in the confidence intervals around the estimates.

Non-sampling error is not reflected in the confidence intervals of the estimates, and the direction and magnitude of this error is difficult to estimate accurately. Because of non-sampling error, the total error in the estimate is typically larger than the estimated confidence intervals shown in the report.

Some sources of **non-sampling error** are:

- Non-coverage occurs because not all adult members of the general population were included in the sample. If these adults differed in a significant and consistent way from adults living in landline telephone households, then estimates presented in this report could be biased.
 - Adults living in nursing homes, prisons, military barracks, or college dormitories were excluded.
 - ♦ Adults living in cell-phone-only households were excluded. Rates of landline telephone non-coverage were lower for some subgroups within the population than for others, e.g., lower income households may be under-represented in the final estimates.

- Non-response is the inability to obtain responses from all individuals selected to be in the sample.
 - Unit non-response occurs when a respondent cannot be reached or refuses to participate. It can also result from language/cultural barriers or a disability that precludes participation in a telephone interview.
 - Item non-response occurs when a respondent refuses to answer a particular question or doesn't know or can't recall the answer, or the question is inadvertently skipped in the interview (though use of a computer -aided telephone interviewing system, Ci3 CATI, in the case of the NM BRFSS, prevents errors in skip patterns).
- **Measurement error** is error due to inaccurate responses.
 - Inaccurate answers may be given by respondents who misunderstand questions, have faulty memory, or deliberately give false answers. The accuracy of the responses may also be influenced by attitudes toward the interview, the subject of the questions, the interviewer's tone of voice, or the length of the interview.
 - Erroneous recording of data is another form of measurement error.

APPENDIX I—METHODS

Quality assurance

While error in survey estimates cannot be avoided entirely, the Survey Section goes to great lengths to reduce non-sampling error. Some examples of measures taken to reduce error include:

- Training the interviewers at hire, at the beginning of each new survey year, and at the beginning of each new month of the survey.
- ♦ Prompt and frequent feedback to interviewers.
- Review of keyed data for extreme or invalid values by a software program at the end of the each month, prior to submission of the data to the CDC.
- ♦ All interviewers are monitored at least once a month. New interviewers are monitored consistently until CDC BRFSS protocol is followed.

Implications of Sampling Design for Estimates Presented in this Report

The estimates presented in this report are weighted percentages. The percentage of respondents in the sample who reported engaging in a particular behavior (or who reported diagnosis of a particular condition/disease) was adjusted by a weighting factor to produce the prevalence estimate for the adult population as a whole. There are several components to the weight used to adjust the sample percentage.

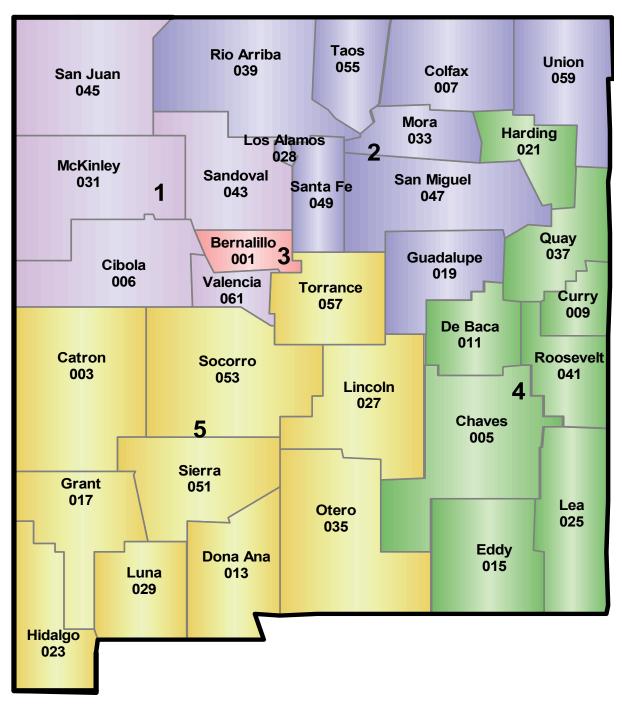

- The Sampling Weight adjusts for the fact that adults within the population had different probabilities of being included in the sample, because:
 - Households with phone numbers in the low-density stratum (described under Sample Selection above) had a lower probability of being selected than households with phone numbers in the highdensity stratum.
 - Households with more than one landline telephone line had a greater chance of being selected.
 - In households containing many adults, each adult had a proportionally smaller chance of being randomly selected than an adult who was the sole adult of the selected household.
- ♦ A post-stratification weighting procedure was used to adjust for differences between the distribution of the sample and that of the population, by gender, age, and region of residence, as determined by the Census. This component of the weighting process attempts to adjust the estimates so that they better reflect the adult population of the state.

The final weight is the product of the sampling weight and the post-stratification weight.

Stata 10 MP software was used for all analyses in this report. Stata 10 MP includes a suite of data analysis commands which are specifically designed for the analysis of complex sample survey data, such as that of the BRFSS.

APPENDIX II—MAP

The 2008 NM BRFSS sample was stratified according to the NM Department of Health Regions, depicted below. Estimates for Health Regions have been presented at the bottom of each table, throughout this report.

Northwest, Region 1: San Juan, McKinley, Sandoval, Cibola, Valencia

Northeast, Region 2: Rio Arriba, Taos, Colfax, Union, Los Alamos, Santa Fe, Mora, San Miguel, Guadalupe

Bernalillo County, Region 3

Southeast, Region 4: Harding, Quay, DeBaca, Curry, Roosevelt, Chaves, Eddy, Lea

Southwest, Region 5: Torrance, Catron, Socorro, Lincoln, Grant, Sierra, Hidalgo, Luna, Doña Ana, Otero
