

New Mexico Healthcare-associated Infections Annual Report for 2024

Facility-specific Addendum

The information presented here supplements the New Mexico Healthcare-associated Infections Annual Report prepared by the New Mexico Healthcare-associated Infections Advisory Committee and released July 2019. The report is available at [Healthcare-Associated Infections](#).

Facility-specific healthcare-associated infection data can be used in your conversations with your healthcare providers to discuss what is being done to protect your health and what prevention steps you can also take.

The National Healthcare Safety Network (NHSN)—the Centers for Disease Control and Prevention (CDC) national healthcare-associated infections (HAI) electronic tracking system—reset the national baseline in 2015, meaning that the target standardized infection ratio (SIR) was changed using updated infection data and risk adjustment methodology. Previously calculated SIRs had different baseline years for each infection and facility type; therefore, the SIRs from previous years cannot be directly compared to the SIRs calculated using the updated baseline. Because the risk adjustment models used to calculate SIRs with 2015 baseline data differ for acute care hospitals and critical access hospitals, and are reported separately by NHSN, the data are presented here in separate tables.

The 2024 data in all tables reflect a snapshot of data available in NHSN as of September 19, 2025.

Facility-specific central line-associated bloodstream infection data

Table 1: Acute care hospital adult and/or pediatric intensive care unit (ICU) central line-associated bloodstream infection (CLABSI) reporting, with or without standardized infection ratios (SIRs)

Table 1a: Critical access hospital adult and/or pediatric intensive care unit (ICU) central line-associated bloodstream infection (CLABSI) reporting, with or without standardized infection ratios (SIRs)

Table 2: Neonatal intensive care unit (NICU) central line-associated bloodstream infection (CLABSI) facility-specific reporting, with or without standardized infection ratios (SIRs)

Table 3: Acute care hospital non-intensive care unit (non-ICU) wards central line-associated bloodstream infection (CLABSI) facility-specific reporting, with or without standardized infection ratios (SIRs)

Table 3a: Critical access hospital non-intensive care unit (non-ICU) wards central line-associated bloodstream infection (CLABSI) facility-specific reporting, with or without standardized infection ratios (SIRs)

Facility-specific laboratory-identified *Clostridium difficile* infection and methicillin-resistant *Staphylococcus aureus* bacteremia infection data

Table 4: Acute care hospital facility-wide inpatient laboratory-identified *Clostridium difficile* infections (CDI)

Table 4a: Critical access hospital facility-wide inpatient laboratory-identified *Clostridium difficile* infections (CDI)

Table 5: Acute care hospital facility-wide inpatient laboratory-identified methicillin-resistant *Staphylococcus aureus* (MRSA) infections

Table 5a: Critical access hospital facility-wide inpatient laboratory-identified methicillin-resistant *Staphylococcus aureus* (MRSA) infections

Facility-specific catheter-associated urinary tract infection data

Table 6: Acute care hospital facility catheter-associated urinary tract infection (CAUTI) facility-specific reporting, with or without standardized infection ratios (SIRs)

Table 6a: Critical access hospital facility catheter-associated urinary tract infection (CAUTI) facility-specific reporting, with or without standardized infection ratios (SIRs)

Facility-specific healthcare personnel influenza vaccination rates for influenza seasons 2023-2024 2022-2023, 2020-2021 and 2019-2020.

Table 7: Healthcare personnel (HCP) influenza vaccination rates for facilities participating in voluntary NM HCP influenza vaccination data submission for the 2015-2016 through 2018-2019 seasons, current NM statewide aggregate rate for this group, and national goals

Table 1: Acute care hospital adult and/or pediatric intensive care unit (ICU) central line-associated bloodstream infection (CLABSI) reporting, with or without standardized infection ratios (SIRs)

This table shows the observed and predicted CLABSIs for all acute care hospitals which reported ICU data for January through December 2024. Where NHSN predicted less than one CLABSI, a SIR is not calculated.

Acute Care Hospital	Number of units in SIR calculation	Number of CLABSIs observed by the facility	Number of CLABSIs predicted by NHSN calculation *	Facility ICU-only SIR [†]	95% confidence interval [‡] Lower Upper	Comparison between facility ICU SIR and NHSN SIR (1.0) [§]

CLABSI = central line-associated bloodstream infection

ICU = intensive care unit

NHSN = National Healthcare Safety Network

SIR = standardized infection ratio

NC = Not calculated. In alignment with reporting standards followed by NHSN and CDC, facilities with less than one predicted infection does not have an SIR calculated (NC) due to reduced reliability of data. The lower bound of the 95% confidence interval is not calculated (NC) when the observed infections equal zero.

* Calculated from 2015 baseline CLABSI data for corresponding location type and central line days.

†The SIR is a summary statistic used to compare the healthcare-associated infection (HAI) experience of a particular group to a reference population (i.e., NHSN 2015 baseline). The SIR calculation is based on dividing the total number of observed CLABSI events by a “predicted” number of events using the CLABSI rates from the reference population.

‡ The confidence interval indicates that 95% of the time, the true value of the SIR lies somewhere between the upper and lower limits of this range. When the SIR is near zero or equal to zero, the lower bound of the 95% confidence interval is not calculated, therefore shown as “NC.”

§Comparison to the NHSN SIR (i.e., the national reference population) is based on a 95% confidence interval. When the confidence interval includes 1.0 it is not considered statistically significant, therefore categorized as “no different” and indicated by a green square. When the confidence interval does not include 1.0 it is considered statistically significant. When the confidence interval is less than 1.0 the categorization is “better” than the national reference population, indicated by a blue star, and when the confidence interval is greater than 1.0 the categorization is “worse,” indicated by an orange circle

Table 2: Neonatal intensive care unit (NICU) central line-associated bloodstream infection (CLABSI) facility-specific reporting, with or without standardized infection ratios (SIRs)

This table shows the observed and predicted CLABSIs for all facilities which submitted NICU CLABSI data for January through December 2024. For facilities where NHSN predicted less than one CLABSI, a SIR is not calculated.

Facility	Number of units in SIR calculation	Number of CLABSIs observed by the facility	Number of CLABSIs predicted by NHSN calculation *	Facility NICU-only SIR†	95% confidence interval‡ Lower Upper	Comparison between facility NICU SIR and NHSN SIR (1.0)§

CLABSI = central line-associated bloodstream infection

NHSN = National Healthcare Safety Network

NC = Not calculated. In alignment with reporting standards followed by NHSN and CDC, facilities with less than one predicted infection do not have an SIR calculated (NC) due to reduced reliability of data. The lower bound of the 95% confidence interval is not calculated (NC) when the observed infections equal zero.

*Calculated from 2015 NHSN baseline CLABSI data for corresponding location type and central line days.

†The SIR is a summary statistic used to compare the healthcare-associated infection (HAI) experience of a particular group to a reference population (i.e., NHSN 2015 baseline). The SIR calculation is based on dividing the total number of observed CLABSI events by a "predicted" number of events using the CLABSI rates from the reference population.

‡The confidence interval indicates that 95% of the time, the true value of the SIR lies somewhere between the upper and lower limits of this range. When the SIR is near zero or equal to zero, the lower bound of the 95% confidence interval is not calculated, therefore shown as "NC."

§Comparison to the NHSN SIR (i.e., the national reference population) is based on a 95% confidence interval. When the confidence interval includes 1.0 it is not considered statistically significant, therefore categorized as "no different" and indicated by a green square. When the confidence interval does not include 1.0 it is considered statistically significant. When the confidence interval is less than 1.0 the categorization is "better" than the national reference population, indicated by a blue star, and when the confidence interval is greater than 1.0 the categorization is "worse," indicated by an orange circle.

Table 3: Acute care hospital non-intensive care unit (non-ICU) ward central line-associated bloodstream infection (CLABSI) facility-specific reporting, with or without standardized infection ratios (SIRs)

This table shows the observed and predicted CLABSIs for acute care hospitals which reported non-ICU CLABSI data for January through December 2024. For facilities where NHSN predicted less than one CLABSI, a SIR is not calculated.

Acute Care Hospital	Number of units in SIR calculation	Number of CLABSIs observed by the facility	Number of CLABSIs predicted by NHSN calculation*	Facility non-ICU SIR†	95% confidence interval‡ Upper Lower		Comparison between facility non-ICU SIR and NHSN SIR (1.0)§

CLABSI = central line-associated bloodstream infection

ICU = intensive care unit

NHSN = National Healthcare Safety Network

SIR = standardized infection ratio

NC = Not calculated. In alignment with reporting standards followed by NHSN and CDC, facilities with less than one predicted infection do not have an SIR calculated (NC) due to reduced reliability of data. The lower bound of the 95% confidence interval is not calculated (NC) when the observed infections equal zero.

*Calculated from 2015 baseline NHSN CLABSI data for corresponding location type and central line days.

†The SIR is a summary statistic used to compare the healthcare-associated infection (HAI) experience of a particular group to a reference population (i.e., NHSN 2015 data). The SIR calculation is based on dividing the total number of observed CLABSI events by a "predicted" number of events using the CLABSI rates from the reference population.

‡The confidence interval indicates that 95% of the time, the true value of the SIR lies somewhere between the upper and lower limits of this range. When the SIR is near zero or equal to zero, the lower bound of the 95% confidence interval is not calculated, therefore shown as "NC."

§Comparison to the NHSN SIR (i.e., the national reference population) is based on a 95% confidence interval. When the confidence interval includes 1.0 it is not considered statistically significant, therefore categorized as "no different" and indicated by a green

square. When the confidence interval does not include 1.0 it is considered statistically significant. When the confidence interval is less than 1.0 the categorization is “better” than the national reference population, indicated by a blue star, and when the confidence interval is greater than 1.0 the categorization is “worse,” indicated by an orange circle.

Table 4: Acute care hospital facility-wide inpatient laboratory-identified *Clostridium difficile* infections (CDI)

This table shows the number of infections identified through positive laboratory tests of inpatients with healthcare facility-onset (HO) infections (i.e., positive tests on specimens collected more than three days after admission) for January through December 2024.

Acute Care Hospital	Number of hospital-onset CDI events observed by facility	Number of events predicted by NHSN calculation *	Facility SIR [†]	95% confidence interval [‡]		Comparison between facility SIR and NHSN SIR (1.0) [§]

NHSN = National Healthcare Safety Network

SIR = standardized infection ratio

NC = Not calculated. In alignment with reporting standards followed by NHSN and CDC, facilities with less than one predicted infection do not have an SIR calculated (NC) due to reduced reliability of data. The lower bound of the 95% confidence interval is not calculated (NC) when the observed infections equal zero.

*Calculated from 2015 NHSN CDI LabID data.

†The SIR is a summary statistic used to compare the healthcare-associated infection (HAI) experience of a particular group to a reference population (i.e., NHSN 2015 baseline data). The SIR calculation is based on dividing the total number of observed events by a “predicted” number of events using the rates from the reference population.

‡The confidence interval indicates that 95% of the time, the true value of the SIR lies somewhere between the upper and lower limits of this range. When the SIR is near zero or equal to zero, the lower bound of the 95% confidence interval is not calculated, therefore shown as “NC.”

§Comparison to the NHSN SIR (i.e., the national reference population) is based on a 95% confidence interval. When the confidence interval includes 1.0 it is not considered statistically significant, therefore categorized as “no different” and indicated by a green square. When the confidence interval does not include 1.0 it is considered statistically significant. When the confidence interval is less than 1.0 the categorization is “better” than the national reference population, indicated by a blue star, and when the confidence interval is greater than 1.0 the categorization is “worse,” indicated by an orange circle.

Table 5: Acute care hospital facility-wide inpatient laboratory-identified methicillin-resistant *Staphylococcus aureus* (MRSA) infections

This table shows the number of MRSA infections identified through positive laboratory tests of inpatients with healthcare facility-onset (HO) infections (i.e., positive tests on specimens collected more than three days after admission) for January through December 2024.

Acute Care Hospital	Number of hospital-onset MRSA events observed by facility	Number of events predicted by NHSN calculation *	Facility SIR [†]	95% confidence interval [‡]		Comparison between facility SIR and NHSN SIR (1.0) [§]

NHSN = National Healthcare Safety Network

SIR = standardized infection ratio

NC = Not calculated. In alignment with reporting standards followed by NHSN and CDC, facilities with less than one predicted infection do not have an SIR calculated (NC) due to reduced reliability of data. The lower bound of the 95% confidence interval is not calculated (NC) when the observed infections equal zero.

*Calculated from 2015 NHSN CDI LabID data.

†The SIR is a summary statistic used to compare the healthcare-associated infection (HAI) experience of a particular group to a reference population (i.e., NHSN 2015 baseline data). The SIR calculation is based on dividing the total number of observed events by a “predicted” number of events using the rates from the reference population.

* The confidence interval indicates that 95% of the time, the true value of the SIR lies somewhere between the upper and lower limits of this range. When the SIR is near zero or equal to zero, the lower bound of the 95% confidence interval is not calculated, therefore shown as “NC.”

§Comparison to the NHSN SIR (i.e., the national reference population) is based on a 95% confidence interval. When the confidence interval includes 1.0 it is not considered statistically significant, therefore categorized as “no different” and indicated by a green square. When the confidence interval does not include 1.0 it is considered statistically significant. When the confidence interval is less than 1.0 the categorization is “better” than the national reference population, indicated by a blue star, and when the confidence interval is greater than 1.0 the categorization is “worse,” indicated by an orange circle

Table 6: Acute care hospital adult catheter associated urinary tract infection (CAUTI) reporting, with or without standardized infection ratios (SIRs)

This table shows the observed and predicted CAUTIs for all acute care hospitals which reported data for January through December 2024. Where NHSN predicted less than one CAUTI, a SIR is not calculated.

Facility	Number of units in SIR calculation	Number of CAUTIs observed by the facility	Number of CAUTIs predicted by NHSN calculation *	Facility SIR†	95% confidence interval‡		Comparison between facility SIR and NHSN SIR (1.0)§

CAUTI = catheter-associated urinary tract infection

ICU = intensive care unit

NHSN = National Healthcare Safety Network

SIR = standardized infection ratio

NC = Not calculated. In alignment with reporting standards followed by NHSN and CDC, facilities with less than one predicted infection does not have an SIR calculated (NC) due to reduced reliability of data. The lower bound of the 95% confidence interval is not calculated (NC) when the observed infections equal zero.

* Calculated from 2015 baseline CAUTI data for corresponding location type and central line days.

†The SIR is a summary statistic used to compare the healthcare-associated infection (HAI) experience of a particular group to a reference population (i.e., NHSN 2015 baseline). The SIR calculation is based on dividing the total number of observed CAUTI events by a "predicted" number of events using the CAUTI rates from the reference population.

‡ The confidence interval indicates that 95% of the time, the true value of the SIR lies somewhere between the upper and lower limits of this range. When the SIR is near zero or equal to zero, the lower bound of the 95% confidence interval is not calculated, therefore shown as "NC."

Table 6a: Critical access hospital adult catheter associated urinary tract infection (CAUTI) reporting, with or without standardized infection ratios (SIRs)

This table shows the observed and predicted CAUTIs for all acute care hospitals which reported data for January through December 2024. Where NHSN predicted less than one CAUTI, a SIR is not calculated.

Facility	Number of units in SIR calculation	Number of CAUTIs observed by the facility	Number of CAUTIs predicted by NHSN calculation *	Facility SIR [†]	95% confidence interval [‡]		Comparison between facility SIR and NHSN SIR (1.0) [§]

CAUTI = catheter-associated urinary tract infection

ICU = intensive care unit

NHSN = National Healthcare Safety Network

SIR = standardized infection ratio

NC = Not calculated. In alignment with reporting standards followed by NHSN and CDC, facilities with less than one predicted infection does not have an SIR calculated (NC) due to reduced reliability of data. The lower bound of the 95% confidence interval is not calculated (NC) when the observed infections equal zero.

* Calculated from 2015 baseline CAUTI data for corresponding location type and central line days.

[†]The SIR is a summary statistic used to compare the healthcare-associated infection (HAI) experience of a particular group to a reference population (i.e., NHSN 2015 baseline). The SIR calculation is based on dividing the total number of observed CAUTI events by a “predicted” number of events using the CAUTI rates from the reference population.

[‡] The confidence interval indicates that 95% of the time, the true value of the SIR lies somewhere between the upper and lower limits of this range. When the SIR is near zero or equal to zero, the lower bound of the 95% confidence interval is not calculated, therefore shown as “NC.”

Table 7: Healthcare personnel (HCP) influenza vaccination rates for facilities participating in voluntary NM HCP influenza vaccination data submission for the 2019-2024 seasons.
