2013 NM-YRRS Results: Behavior Comparisons, New Mexico and United States

National Youth Risk Behavior Survey (YRBS) results released in June allow comparisons between New Mexico and US high school students. In 2013, compared to their US peers, NM students had higher rates of drug use (including lifetime use of cocaine, heroin, methamphetamines, and using marijuana before age 13). NM students also had higher rates for physical fighting on school property and carrying weapons. While NM students had a higher rate of drinking alcohol before age 13, they were less likely to engage in binge drinking. NM students were less likely to be sexually active, and had healthier rates for behaviors related

to diet (daily soda consumption) and physical activity (daily physical activity and time spent watching television).

For more NM-US comparisons of high school risk behaviors, see www.youthrisk.org or nmhealth.org/go/youth. Statistical significance determined by a t-test on the website, Youth Online (nccd.cdc. gov/youthonline).
